6-23-2009 Sue called and said some workers were driving off ROW on her property. She said they drove down the section line and entered a gate where they don't have permission. She said they section line road was closed by the County and she owns it. She said they were putting up the goal posts by the power lines. She also asked for 48 hr notice before anyone enters her property. I told her we gave her notice in April that construction would be starting and they can expect activity anytime after that.

6-03-2009 I called Sue and told her the survey crew was planning on finishing up on their property today. I asked her about the fence estimate. She said her fence people were waiting until the property was staked before they do an estimate. She will mail it to the Huron office when she gets it.

Mike and Sue Sibson,

Sue about 2 months ago you called my office saying you saw an ad in the paper relating to water lines that could be replaced within 500' of residences. You stated you were unsure if your line fell into the condition of the PUC order but wanted to be on the list. TransCanada has followed up on your request and found that the water line that runs to your house is at least 1000' from the Keystone Pipeline.

I have attached a photo from KingBrook Rural Water that shows the water system near your home. Please note that Keystone Pipeline is further away than 500'.
Please contact me at the information below if you have any further questions.

Sincerely,
Paul Kleist

Kerwin/Jeff,

Kingbrook sent me their water line service map for the Sibson property on which I plotted the Keystone pipeline from the land plat (See attachment). While the dimensions are not such that you can determine the exact spacing, it is clear that the closest distance between the Sibson water service line and Keystone pipeline is more than 1000 feet, probably between 1200 and 1300 feet. The only way to get the exact spacing would be to pay Kingbrook to dig up the service line and have our surveyors measure the spacing.

Subject: RE: Sue Sibson --Kingbrook Rural Water

Kerwin –

I believe Charles Stewart has (or had) the action on this item as it relates to Kingbrook. While the PUC Condition does not address required communication with landowners who seek replacement as Sue has done, I presume after our check with Kingbrook is complete, the issue will come back to Land so we can close the loop with Sue to let her know we have addressed her request. (And, given her history with the project, we should make sure our work in response to her request is well documented.)

APPENDIX B

Table 3: Status of implementation of South Dakota PUC conditions

49	At the request of any landowner or public water supply system that offers to provide the necessary access to Keystone over his/her property or easement(s) to perform the necessary work, Keystone shall replace at no cost to such landowner or public water supply system, any polyethylene water piping located within 500 feet of the Project. Keystone shall not be required to replace that portion of any piping that passes through or under a basement wall or other wall of a home or other structure. At least forty-five (45) days prior to commencing construction, Keystone shall publish a notice in at least one newspaper of general circulation in each county through which the Project will be constructed advising landowners and public water supply systems of this condition.

Contact Summary: Contact Summary: On 6-25-09 I received permission from John Hunt to pay the Sibson's for the fence that they have requested. I called the Sibson's and set up an appointment to meet with them at 4pm at their house. I drew up the paperwork and drove to the Sibson's home and met with Michael and Susan. They reviewed the documents and signed them. I wrote the check to Michael B. and Susan K. Sibson in the amount of $21.818.06 for the cost to install and tear down after time the fence.

It totals, $21,000.00, the bid is for a very good steel and wood post fencing with 12 16-20' steel gates.

RE: fence estimate for Sibson land

Dear Paul,
Enclosed is a copy of the fence estimate from Heartland Custom Fencing, L.L.C. Please note their payment plan. We would like a decision about our fence request within 7 days or less of this letter.

Thank you.
Sincerely,
Mike and Sue Sibson

4-10-2009 I, Paul Kleist and Sarah Metcalf met with Mike and Sue. They gave us 2 options. Fence where they want or pay them $30,000.00 for loss of income and they will keep their cattle out of the area where the pipeline will go. They believe their yearlings are curious and will get in the way of construction and PETA will go after them for not being responsible farmers and putting their cattle in harms way. Sue said If we don't give them the fence they will bill us for extra security and having to watch their cattle.

1-23-2009 I met with the Sibsons. They said they want their attorney to review the atws agreement before they sign it. We partially filled out a construction agreement but they want their attorney to review it before they sign it and they will not sign it until they get a few questions answered. They want a permanent fence put up along the West edge of the ROW when construction is done. They will turn that everything East into pasture as they don't want to farm over the pipe. There are a few acres of farm ground that will be cut off by the ROW and want to know if they are going to be compensated for crop loss on it. They want a temporary fence put along the East side of the ROW in 3 areas for their cattle during construction. They will need access across the ROW for their cattle in 2 areas. They want speed limit signs put on the roads surrounding their house. They said they will be watching and they better not see any trash, cigarette butts, or sunflower seeds on their property especially outside the ROW.

I wrote a check for the claim of Michael Sibson and Garry Nutter for extra mileage and labor from the 2008 harvest.

Huron SD 57350

Dear Sarah Metcalf:

Due to the construction of a substation located in Section 1 Perry Township Davison County Mitchell SD, the road (412th Ave) was too rough for loaded farm vehicles and equipment to travel. We had to travel extra miles to get our harvested crops to storage bins. The road was closed for travel during our harvest.
We would like reimbursement for the labor costs (inconvenience) and extra miles traveled for 2008 soybean and corn harvest.

Harvest expense Davison County:

Trucks 36 miles @ $3.00 a load = $108.00

Combine and tractor with gravity wagons 16 miles @ $2.00 a load =$32.00

Pickup 32 miles @.585 = $18.72

Labor 4 hours @ $15.00=$60.00

Total $218.72

Sincerely,
Gary Nutter Mike Sibson

Dear Mr. and Mrs. Sibson:

Per your request, the following are findings of survey activity of your property:

Meghan, as I explained on the phone, drove by the property and did not need to survey.

The other information I received was a partial wetland survey about .34 miles on section 33. One wetland was identified. There was no cultural survey on either tract. No cultural resources were identified. No Threatened &Endangered species surveys have been conducted on either tract.

You may find our Construction Mitigation and Reclamation plan online: puc.sd.gov / commission dockets/ hydrocarbonpipeline/ 2007/ HP07-0001 under Exhibit B.

9-23-2013 I met with Ray and Lillian. I explained our project manager and environmental people agreed they don't have a solution for the erosion over the ROW. Their plan is to fix the drainage on the South, re-grade and bring to level the ROW and plant it to grass. I offered 160 bu corn x 6.8 acres x $7 per bushel x 5 years for crop loss due to ROW being planted to grass. They said they would think about it and get back to me. Lillian said she didn't want the transition line touched. Total amount due $38,080.00

10-11-2013 I called Lillian to inform of upcoming wetland survey. She asked what they were doing and why and for what agency. I called back and informed her.

10-14-2013 Lillian called and said Ray thought it was ok to do the wetland survey. She also said they would agree to the offer made to work on the ROW and plant it to grass. I explained it would be next year when they can do the work.

From here do the best we can to stop the erosion by levelling and planting grass. Use laser transit. Bring grade up. Need to build up on south side

Mr. Thys. ~~Never~~ washed out until pipeline was cut. Water really started cutting west of ROW after const. ~~first~~ 3 or 4 to 10 years any seed will be washed away. She would to know how much has been spent to do repairs ~~since~~ since construction.

Mr. or Mrs. Anderson are not financially responsible for ~~any~~ any damage repairs ~~on~~ on the ROW or ~~or~~ damages outside of ROW that was caused by the pipeline installation.

Mrs Anderson request this ~~quarter~~ quarter section to be bought by TransCanada. He stated $5000.00 per acre.

Landowner(s): Lillian and Raymond Anderson

Address: 12189 415th Ave City/Town: Langford

County: _____ Township: _____ State: SD Zip Code: 57454

Telephone: Home :(605) 493-6438 Business : 605-448-8059

Frank-
We are here to the best we can to stop the erosion by levelling and planting grass. Use laser transits. Bring grad up. Need to build up on south side.

Mr. & Mrs. Anderson-
Never washed out until pipeline was cut. Water really started cutting west of ROW after construction 8 out of 10 years any seed will be washed away. She would like to know how much has been spent to do repairs since construction.

Mrs. Anderson asked that the following be written.
Mr. and Mrs Anderson are not financially responsible for any damage repairs on the ROW or damages outside the ROW that was caused by the pipeline installation.

Mr. Anderson requests this quarter section to be bought by TransCanada. He stated $5000.00 per acre.

160 bushels corn
X 6.8 acres
1088 bushels
X $7.00 per bushels
$7616.00
5 Years
$38,080.00

The original document was signed and / or initialed by the following on October 2, 2014:

Contact Summary:

Eric and I went to meet with Mr. & Mrs. Sibson. They called last week complaining about the air plane spooking the calves they have. They stated the plane flew over on the west side of the ROW near there home and cattle pens. They wanted the name and number for the company that does the flights. We was informed by Josh that he is correct person to contact and we informed the Sibson's. They stated that the fly over had been very good about this until the other day. They also stated if they don't do as was promised about flying on the east side they will take this matter up with there attorney. We told them we would inform the proper personnel about this.

BEFORE THE PUBLIC UTILITIES COMMISSION
OF THE STATE OF SOUTH DAKOTA

IN THE MATTER OF THE PETITION OF TRANSCANADA KEYSTONE PIPELINE, LP FOR ORDER ACCEPTING CERTIFICATION OF PERMIT ISSUED IN DOCKET HP09-001 TO CONSTRUCT THE KEYSTONE XL PIPELINE	* * * * * * * * *	**STAFF'S RESPONSE TO DAKOTA RURAL ACTION'S FIRST SET OF INTERROGATORIES AND DATA REQUESTS** **HP14-001**

COMES NOW, Commission Staff by and through its attorney of record, Kristen N. Edwards, and hereby provides the following Response to Dakota Rural Action's First Set of Interrogatories and Data Requests ("Response"). For the purpose of this response any reference to "dockets" refers to HP09-001 and HP14-001, unless otherwise stated.

Dated this 6th day of February, 2015.

Kristen N. Edwards, Staff Attorney
PUC Staff
500 East Capitol Avenue
Pierre, SD 57501

INTERROGATORIES

INTERROGATORY NO. 1. Please identify the person or persons providing each answer to an Interrogatory or portion thereof, giving the full name, address of present residence, date of birth, business address and occupation. *[Applicable Finding or Condition No.: all]*

RESPONSE: OBJECTION. Staff objects as to the relevance of the address of present residence and date of birth for each person providing each answer. Subject to and without waiving its objection, Staff will provide the name, occupation, and business address of the persons providing each answer to the Interrogatories.

Kristen Edwards
Staff Attorney
South Dakota Public Utilities Commission
500 E. Capitol Avenue
Pierre, SD 57501

Darren Kearney
Staff Analyst
South Dakota Public Utilities Commission
500 E. Capitol Avenue
Pierre, SD 57501

Brian Rounds
Staff Analyst
South Dakota Public Utilities Commission
500 E. Capitol Avenue
Pierre, SD 57501

Mary Zanter
Pipeline Safety Program Manager
South Dakota Public Utilities Commission
500 E. Capitol Avenue
Pierre, SD 57501

INTERROGATORY NO. 2. Prior to answering these interrogatories, have you made due and diligent search of all books, records, and papers of the Applicant with the view of eliciting all information available in this action? *[Applicable Finding or Condition No.: all]*

RESPONSE: Staff has exercised due diligence, however, we will continue to review the evidence throughout the certification processes and as new information becomes available.

INTERROGATORY NO. 3. Describe the current status of the following permits and plans required prior to the start of construction of the KXL Pipeline:

A. Permits from US Army Corps of Engineers, S.D. Regulatory Office, including under:

1) §§404/401 of Clean Water Act, for authorization of discharge of fill material into waters of the United States including wetlands or other action;
2) §10 Rivers and Harbors Act, for authorization of pipeline crossings of navigable waters of the United States or other action;
3) Section 106 of the Natural Historic Preservation Act (NHPA), including consultation with potentially impacted Tribes and/or other action;

B. Permits from U.S. Fish and Wildlife Service, S.D. Ecological Services Field Office, including under the Endangered Species Act, Section 7 Consultation, to consider lead agency findings of impacts on federal-listed species, to provide a Biological Opinion if the Project is likely to adversely affect federally-listed or proposed species or their habitats, or other action;

C. Permits from Farm Service Agency of the Natural Resources Conservation Service, including the Crop Reserve Program, for authorization of crossing areas enrolled in the Crop Reserve Program, or other action;

D. Permits from the Pipeline and Hazardous Materials Safety Administration (PHMSA), including under 49 CFR Parts 194 and 195, for development of an Integrity Management Plan (IMP) and Emergency Response Plan (ERP), or other action;

E. Permit(s) from or Plan(s) Required to the South Dakota Department of Environment and Natural Resources (DENR), including under:

1) National Pollutant Discharge Elimination System General Permit for Discharges of Hydrostatic Test Water, regarding proposed discharge into waters of the United States and construction dewatering of waters of the State, or other action;
2) Surface Water Withdrawal Permit, for temporary surface water withdrawal, or other action;
3) SDCL Chapter §34A-18, required submission of an Oil Spill Response Plan or Updated Plan to DENR, or other action;

F. Consultation with SD Game Fish and Parks Department, under State Listed Threatened and Endangered Species;

G. Any Updated Review and Comment from South Dakota State Historical Society, State Preservation Office, under §106 of the NHPA, on activities regarding jurisdictional cultural resources;

H. Crossing Permits from South Dakota Department of Transportation for crossing State highways;

I. Crossing Permits from County Road Departments for crossing of county roads;

J. Flood plain, Conditional Use, and building permits where required from County and Local Authorities.

[Applicable Finding or Condition No.: Conditions 1, 2; Findings 12(1)-(3), 60, 88, 90, 97-99]

RESPONSE: OBJECTION. This question improperly attempts to shift the burden to produce permits from the Company to Staff. Subject to and without waiving the objection, Staff provides the following answer.

Staff does not have this information, nor is it readily obtainable. The PUC is neither the issuer nor the issuee of the permits listed in Interrogatory No. 3. The only information Staff has regarding the status of permits is the information provided by Keystone in its Quarterly Report. This most recent information can be found in Section 5.0 of the December 31, 2014 Quarterly Report, filed in docket HP09-001.

As for consultation with SD Game Fish and Parks Department (GF&P), as described in subpart F of the interrogatory, Staff does not have this information, but does intend to call a witness from GF&P and will continue to work with that witness to gather information. Therefore, no additional information, beyond what is available in Docket No. HP09-001 is available at present. Staff will supplement this response if necessary in the future.

In response to subparts H and I, this information is included in Keystone's Quarterly Report, which the PUC has made available online. For current information, see the most recent quarterly report filed in HP09-001

INTERROGATORY NO. 4. Do you agree that diluted bitumen spills require different spill response techniques and different equipment types and amounts as compared to (a) a spill of conventional crude oil and (b) a spill of Williston Basin light crude oil? Please explain your answer and list any scientific study(ies) providing the basis for your answer. *[Applicable Finding or Condition No.: Amended Condition 31-42]*

RESPONSE: OBJECTION. The question calls for a legal conclusion. Subject to and without waiving the objection, Staff provides the following answer.

Staff does not have an opinion at this time but will continue to work with its experts to investigate this issue.

INTERROGATORY NO. 5. Do you agree that diluted bitumen is heavier than conventional crude and results in greater expenses to remediate leaks or spills? Please explain your answer and identify any known scientific study(ies) providing the basis for your answer. *[Applicable Finding or Condition No.: Amended Condition 31-42/]*

RESPONSE: OBJECTION. This question improperly attempts to shift the burden concerning whether the project continues to meet the conditions upon which the permit was granted from the Company to Staff. Subject to and without waiving the objection, Staff provides the following answer.

Staff does not have an opinion at this time but will continue to work with its experts to investigate this issue.

INTERROGATORY NO. 6. Do you agree that soil and rocks that are contaminated by oil spills cannot be cleaned but instead must be removed and disposed of in hazardous waste facilities? Please explain your answer and list any scientific study(ies) providing the basis for your answer.

A. If so, do you agree that reclamation efforts for oil spills of the magnitude of the worst case discharge amount for the Keystone XL Pipeline fail to recover 100% of the oil contaminating the ground?

B. Identify the Documents created by or on your behalf which would show the basis for your answer to this Interrogatory.

[Applicable Finding or Condition No.: Amended Condition 32-38]

RESPONSE: OBJECTION. This question improperly attempts to shift the burden concerning whether the project continues to meet the conditions upon which the permit was granted from the Company to Staff. Subject to and without waiving the objection, Staff provides the following answer.

Staff does not have an opinion at this time but will continue to work with its experts to review this issue.

INTERROGATORY NO. 7. Describe how the PUC Staff plans to monitor compliance of TransCanada with all conditions imposed by the PUC, together with all applicable laws, and regulations:

A. During construction;
B. During proposed operation;

[Applicable Finding or Condition No.: Amended Condition 1; Finding 73]

RESPONSE: As per the Amended Final Decision and Order in HP09-001, Keystone must provide quarterly reports to the Commission. In addition, the Commission has a formal complaint process available to any person who has a grievance against the company. Staff will also be reviewing compliance filings and following up with any issues we find.

INTERROGATORY NO. 8. Does the PUC Staff have inspectors who will monitor on-site construction of the KXL pipeline?

A. State the number of inspectors;
B. Describe the expertise of each of these inspectors in relevant fields regarding crude oil pipeline construction and operation;
C. Describe how often and what type of inspectors will be on-site:
   i. During construction of the KXL Pipeline;
   ii. During operation of the KXL Pipeline.

[Applicable Finding or Condition No.: Amended Condition 1; Finding 73]

RESPONSE: No. Keystone XL would operate as an interstate pipeline and would, therefore, be under federal jurisdiction for purposes of inspection. The authority to grant siting permits is the sole authority of the PUC with respect to interstate pipelines. Please refer to page 4 of the prefiled testimony of William Walsh in HP09-001.

INTERROGATORY NO. 9. State whether or not the PUC Staff monitors or tracks spill/leak incidents involving operations of TransCanada and its Affiliates:

A. Within South Dakota?

B. Outside South Dakota?
   i. Within the United States;
   ii. Within Canada;

C. To the extend PUC Staff monitors or tracks any of the foregoing, describe the monitoring and tracking procedures engaged in and identify any documents regarding monitoring or tracking procedures, processes or instructions.

[Applicable Finding or Condition No.: Amended Condition 1; Finding 73]

RESPONSE: The PUC does not monitor or track spill/leak incidents involving operations of TransCanada and its Affiliates within or outside of South Dakota. This task is within the jurisdiction of the federal government. Staff suggests contacting either the company itself or the South Dakota Department of Environment and Natural Resources.

INTERROGATORY NO. 10. For each incident since January 1, 2010 in which any pipeline transporting crude oil constructed by TransCanada and its Affiliates in South Dakota leaked or spilled pipeline contents, the:

A. Date;

B. Location:

C. Amount of materials leaked or spilled;

D. Actions taken by the PUC to prevent re-occurrence which did not involve design or construction procedure changes in pipeline material composition or dimensions, or construction procedures for use in the pipeline which suffered the incident.

E. Actions taken to prevent re-occurrence which involved design or construction procedure changes in pipeline material composition or dimensions, or construction procedures for use in construction of the proposed KXL Pipeline;

F. Identify and produce the documents which support your answers, above, including any incident reports.

[Applicable Finding or Condition No.: Findings 12(2)-(3), 41-45, 47, 103; Amended Condition 32-38]

RESPONSE: OBJECTION. This question attempts to shift the regulatory burden from the federal government and the South Dakota Department of Environment Natural Resources (DENR) to the PUC. Subject to and without waiving the objection, Staff provides the following answer.

Because TransCanada reports to the federal government, specifically to agencies such as the Pipeline and Hazardous Materials Safety Administration, Staff does not have this information. Staff suggests contacting either the company itself or DENR. This information may also be accessible through DENR's website (http://arcgis.sd.gov/server/denr/spillsviewer/). However, PUC Staff cannot vouch for the accuracy of the information on DENR's website.

INTERROGATORY NO. 11: Identify all other crude oil pipeline operations of TransCanada and its Affiliates in South Dakota which, since 2009, have or are operating at a maximum operating pressure (MOP) of equal to or greater than 1,440 psig generally and/or 1,600 psig MOP for specific low elevation segments of pipeline with the same design factor and pipe wall thickness as described in Finding 19, close to the discharge of pump stations:

A. For each such pipeline which subsequently developed a leak or spill, regardless of the psig MOP the pipeline was operating at the time, giving date, location, amount spilled/leaked, psig MOP at which pipeline was operating at the time, and describe the amount and nature of damage caused by such a leak or spill;

B. Identify any documents upon which your answers to these Interrogatories were based;

[Applicable Finding or Condition No.: Findings 19, 28]

RESPONSE: The Keystone Pipeline in eastern South Dakota is the only crude oil pipeline operated by TransCanada and its Affiliates in South Dakota of which Staff has knowledge. The PUC sited this pipeline in Docket HP07-001. For information on leaks and spills on this pipeline, see Staff's answer to Interrogatory No. 10.

INTERROGATORY NO. 12: For each spill/leak incident which has occurred from a pipeline transporting Western Canadian Sedimentary Basin (WCSB) crude oil operated by TransCanada and its Affiliates since 2009 in South Dakota, state the dates on which transportation of the crude oil through that pipeline was disrupted by planned maintenance, unplanned maintenance, power outages, spills, leaks, or any other causes. Identify any documents upon which your answers to this Interrogatory was based. *[Applicable Finding or Condition No.: Finding 28]*

RESPONSE: OBJECTION. This question attempts to shift the regulatory burden from the federal government to the state. Subject to and without waiving the objection, Staff provides the following answer.

Because this information is not reported to the PUC, Staff does not have this information.

INTERROGATORY NO. 13: Explain why TransCanada has reduced the maximum operating pressure of the KXL pipeline at most locations to 1,307 psig;

A. State whether the PUC Staff has received information or a commitment from TransCanada about any future plans to subsequently increase this general operating pressure;

B. If your answer to subpart A of this interrogatory is yes, what is the subsequent maximum operating pressure being contemplated for general use during pipeline operations?

C. Explain the PUC Staff's understanding of why TransCanada wants to construct the KXL pipeline pump stations with pumps of sufficient capacity to meet the maximum design flow rate of 830,000 bpd.

[Applicable Finding or Condition No.: Conditions 31-38; Findings 19, 20]

RESPONSE: OBJECTION. This question improperly attempts to shift the burden concerning whether the project continues to meet the conditions upon which the permit was granted from the Company to Staff. Subject to and without waiving the objection, Staff provides the following answer.

This is information that Staff has requested of TransCanada in the discovery process. If necessary, Staff will supplement its response to this interrogatory as more information becomes available.

INTERROGATORY NO. 14: With regard to the plan for mainline valves to be remotely controlled, what guarantee has been received from TransCanada that it is capable of preventing any cyber-security attack on the control system?

A. Describe the worst case scenario which could occur in the event of a computer systems security breach on the control system for the KXL Pipeline.

B. Describe the data security systems TransCanada has indicated to the PUC Staff that it has or plans to be put in place to prevent any such system breach, identify any third-party vendor(s) providing system security software, hardware or monitoring, and identify the particular components or scopes of services such vendors will provide.

C. Identify any documents used to support your answer to this Interrogatory.

[Applicable Finding or Condition No.: Conditions 31-38; Finding 20]

RESPONSE: At this time, Staff does not have the information to answer this question but will continue to investigate this issue throughout the discovery process.

INTERROGATORY NO. 15: Provide the dates on which pipe segments to be used in South Dakota were delivered to storage location in South Dakota or adjacent states and state whether the PUC Staff has or plans to independently inspect the integrity of the stockpiled pipe lengths. If PUC Staff is planning to conduct inspections, describe how those inspections would occur and what factors or information would be reviewed during the course of such inspections.

A. Identify any documents which would support your answers.

[Applicable Finding or Condition No.: Finding 18]

RESPONSE: OBJECTION. The question is argumentative, as it requires the adoption of the assumption that pipe segments have, in fact, been delivered to South Dakota. Subject to and without waiving its objection, Staff provides the following answer.

Staff has no knowledge of pipeline segments being delivered to South Dakota for use on the Keystone XL Pipeline. However, federal regulations do provide for how pipe must be stored, and TransCanada must comply with those regulations.

INTERROGATORY NO. 16: State whether any power lines have been permitted and constructed to provide power to pump stations by local power providers;

A. Identify each such power line;

B. If any State or Tribal permit or other authorization is required for any planned construction of power lines to pump stations:

i. Identify the permits which have been obtained, together with date permit granted;
ii. Identify permits which have not yet been obtained;
iii. Identify which permits have been applied for and are pending.

C. Identify any documents which would support your answers to this interrogatory.

[Applicable Finding or Condition No.: Finding 20; Amended Condition 1]

RESPONSE: No permits have been sought from the PUC for power lines in connection with the Keystone XL pipeline at this time. It is Staff's understanding that Basin Electric Power Cooperative will need to file for a permit to construct a proposed 230-kV transmission line from Big Bend substation to Witten substation. This project is discussed in the Department of State's Final Supplemental Environmental Impact Statement and the Environmental Assessment prepared specifically for the transmission line project.

INTERROGATORY NO. 17: List the changes in the KXL Project route since 2010 and identify any documents which would support your answers. *[Applicable Finding or Condition No.: Finding 33]*

RESPONSE: Staff has sought this information from TransCanada in a discovery request. We do not have this information at this time.

INTERROGATORY NO. 18: Identify paleontological studies within the Upper Cretaceous or Tertiary strata of which you have knowledge were conducted after 2009 in the proximate location of the currently proposed KXL pipeline route and identify any documents which would support your answers. *[Applicable Finding or Condition No.: Findings 34, 36; Conditions 43, 44]*

RESPONSE: OBJECTION. The interrogatory attempts to illicit an answer that would incorrectly have the burden of proof concerning environmental issues to Staff. It is the Company's burden to provide this information.

At this time Staff only has knowledge of certain paleontological studies conducted after 2009 that were completed in order to prepare the Department of State's Final Supplemental Environmental Impact Statement (FSEIS). Descriptions of the studies performed are included in section 3.1.2.3 of the FSEIS.

INTERROGATORY NO. 19: Identify Section 106 type "cultural resource" studies of which you have knowledge that were conducted after 2009 in the proximate location of the currently proposed KXL pipeline route and identify any documents which would support your answers. *[Applicable Finding or Condition No.: Conditions 43, 44]*

RESPONSE: At this time, Staff has knowledge of certain cultural resource studies conducted after 2009 that were completed in order to prepare the Department of State's Final Supplemental Environmental Impact Statement (FSEIS). Descriptions of the studies performed are included in section 3.11.3.3 of FSEIS.

INTERROGATORY NO. 20: TransCanada is to identify the exact locations of active, shut-in, and abandoned wells and any associated underground pipelines in the construction ROW. What is the status of such identification procedures?

A. How long does TransCanada expect such an identification process will take before the Company would be willing to assure the PUC that all such wells and pipelines have been identified;

B. Has TransCanada communicated to the PUC Staff how long it expects such an identification process will take before TransCanada would be willing to assure the PUC that all such wells and pipelines have been identified;

C. How does the PUC Staff intend to ensure compliance by TransCanada with regulations, laws and PUC conditions, in order to protect water resources from contamination?

D. Identify any documents which would support your answers.

[Applicable Finding or Condition No.: Conditions 15, 16, 21, 22, 42]

RESPONSE: OBJECTION. The interrogatory attempts to illicit an answer that would incorrectly have the burden of proof concerning environmental issues to Staff. It is the Company's burden to provide this information.

INTERROGATORY NO. 21. Describe the worst case scenario for landowners of a spill from the proposed pipeline onto only land, as well as other risks deemed "low" by the PUC. Identify any documents which would support your respective answer. *[Applicable Finding or Condition No.: Findings 57; Conditions 16, 31-38]*

RESPONSE: OBJECTION. This question improperly attempts to shift the burden concerning whether the project continues to meet the conditions upon which the permit was granted from the Company to Staff. Subject to and without waiving the objection, Staff provides the following answer.

Staff has requested that TransCanada update that information.

INTERROGATORY NO. 22. Provide a list of claims or complaints (of any kind) made to the Commission by landowners along the existing Keystone I pipeline corridor since 2008. Identify any documents which would support your respective answer. *[Applicable Finding or Condition No.: Finding 57; Conditions 49-50]*

RESPONSE: There have been no formal complaints to the PUC, however, landowner concerns were included in the Liaison Annual Report filed in Docket No. HP09-001. See Section 5 of the most recent Liaison Annual Report.

INTERROGATORY NO. 23. What is the understanding of PUC Staff as to why TransCanada has sought a special permit from the PHMSA for authorization "to design, construct, and operate the Project up to 80% of the steel pipe specified minimum yield strength at most locations."

A. Identify and describe all spills/leaks from TransCanada (or its Affiliates) pipeline operations since 2009 in South Dakota which have involved a "0.8 design factor" and therefore involving use of steel pipe up to 80% of the specified minimum yield strength.

B. Identify documents upon which your answers are based.

[Applicable Finding or Condition No.: Findings 60-61]

RESPONSE: TransCanada is no longer seeking a special permit. TransCanada now seeks to operate at 70% of SMYS.

INTERROGATORY NO. 24. Explain the PUC's understanding of how application of the "0.8 design factor and API 5L PSL2 X70 high-strength steel pipe" with thinner walls would "provide a level of safety equal to or greater than that which would be provided if the pipeline were operated under the otherwise applicable regulations." *[Applicable Finding or Condition No.: Finding 63]*

RESPONSE: This is no longer relevant, as TransCanada is no longer seeking a special permit.

INTERROGATORY NO. 25. Describe how the PUC Staff plans to ensure that TransCanada will thoroughly implement procedures in the CMR to minimize impacts on cultivated lands, grasslands, wetlands, streams, and waterways? Identify documents upon which your answers are based. *[Applicable Finding or Condition No.: Finding 73]*

RESPONSE: There are three methods identified in the *Amended Final Decision and Order; Notice of Entry* that will ensure TransCanada fully and thoroughly implements the CMR. These methods include self-monitoring by TransCanada, self-reporting by TransCanada, and the Commission's formal complaint process.

First, TransCanada will self-monitor the implementation of the CMR through the use of Environmental Inspectors on each construction spread. (Condition 14 and Section 2.2 of the CMR). The Environmental Inspector has the authority, subject to approval from the Chief Environmental Inspector, to stop work and order corrective action if activities violate the CMR. (Section 2.2 of CMR).

Second, TransCanada is required to submit quarterly reports to the Commission until reclamation is complete. According to Condition 8 of the *Amended Final Decision and Order; Notice of Entry*, the quarterly reports must summarize "the status of land acquisition and route finalization, the status of construction, ***the status of environmental control activities***, including permitting status and Emergency Response Plan and Integrity Management Plan development, ***the implementation of the other measures required by these conditions***, and the overall percent of physical completion of the project and design changes of a substantive nature." [***emphasis added***]. PUC Staff expects TransCanada to self-report its implementation of the CMR, or any deviations in the implementation of the CMR, in the quarterly reports in accordance with Condition 8. Should TransCanada self-report any deviations from the CMR, PUC Staff can follow-up with the company in order to ensure proper corrective actions were taken. If issues with CMR implementation remain unresolved, PUC Staff can file a formal complaint against TransCanada as discussed in the following paragraph.

Third, Condition 50 of the *Amended Final Decision and Order; Notice of Entry* identifies that "the Commission's complaint process as set forth in ARSD 20:10:01 shall be available to landowners, other persons sustaining or threatened with damage or the consequences of Keystone's failure to abide by the conditions of the permit or otherwise having standing to obtain enforcement of the conditions of the Order and Permit." Should a landowner or other affected person report to the PUC Staff that TransCanada failed to properly implement the CMR, PUC Staff can either bring a formal complaint against TransCanada or instruct the affected person on how to file a formal complaint. If a complaint is brought before the Commission, the Commission will make its decision on how to resolve the matter based on the specific facts presented during the complaint proceeding.

INTERROGATORY NO. 26. Since 49 CFR Part 195 would require TransCanada Keystone to conduct an "internal inspection" of any pipe section(s) potentially moved by abnormal ground movement, describe the PUC's understanding of the timeframe within which an inspection would take place considering the time required to transport personnel and equipment from their staging area to the most distant segment of the KXL Pipeline in South Dakota, and the time required to notify and mobilize inspectors to their staging area. Identify documents upon which your answers are based.

[Applicable Finding or Condition No.: Finding 101; Conditions 31-38]

RESPONSE: OBJECTION. This question attempts to shift the regulatory burden from the federal government to the state. Subject to and without waiving the objection, Staff provides the following answer.

South Dakota does not have jurisdiction of hazardous liquid lines. Enforcement of 49 CFR is under federal jurisdiction of PHMSA.

INTERROGATORY NO. 27. Identify and produce the most recent IMP submitted to the Commission by TransCanada, including but not limited to section in it related to HCAs. *[Applicable Finding or Condition No.: Finding 102; Conditions 1-2]*

RESPONSE: OBJECTION. This question attempts to shift the regulatory burden from the federal government to the state. Subject to and without waiving the objection, Staff provides the following answer.

South Dakota does not have jurisdiction of hazardous liquid lines. Enforcement of the IMP and related HCAs is under federal jurisdiction of PHMSA.

INTERROGATORY NO. 28. Itemize the property tax payments paid by TransCanada and its Affiliates to respective South Dakota towns, cities, and counties each year since 2010 for the existing Keystone I pipeline and identify the documents upon which you relied to answer these questions;

[Applicable Finding or Condition No.: Finding 23, 102, 108; Conditions]

RESPONSE: The PUC does not have access to this information. It is Staff's belief that this information is held by the Dept. of Revenue.

INTERROGATORY NO. 29. With respect to the jobs TransCanada has alleged it will bring to South Dakota by its proposed pipeline project, describe the most current information provided by TransCanada:

A. As to the number, job title, and expected duration of the temporary construction related jobs provided, and:

i. The percentage of South Dakota citizens are expected to be hired for each job title. ii. Is there any preference for South Dakota citizens to obtain any or all of these
temporary jobs?
iii. State the number and percentage of the total construction jobs expected to be already be filled by out-of-state workers.

B. Describe the most recent information provided by TransCanada as to the number, type, and expected duration of the permanent jobs expected, and;

i. State the number of permanent jobs it expects to be held by current South Dakota citizens, as opposed to someone who moves from out of state to South Dakota to take the job, and;
ii. Will there any preference for South Dakota citizens to obtain any or all of the permanent jobs in South Dakota?

C. Identify the documents upon which you relied to answer these questions;

[Applicable Finding or Condition No.: Finding 23, 102, 108; Conditions 1-2]

RESPONSE: All information the PUC has relevant to this question is posted in Docket No. HP09-001 and is available to the public.

INTERROGATORY NO. 30. Should there be a worst case discharge or even a substantial release of crude oil into farmland and/or water resources and/or an explosion of the pipeline near homes or towns with people, would the PUC Staff still have confidence the proposed KXL Pipeline Project would have only a "minimal" effect on the health, safety, or welfare of its inhabitants. Identify the documents upon which you relied to answer these questions.

[Applicable Finding or Condition No.: Finding 23, 102, 108; Conditions 1,2, 31-36]

RESPONSE: OBJECTION. Staff objects to this interrogatory as it calls for a legal conclusion. Subject to and without waiving its objection, Staff provides the following answer.

SDCL 49-41B-22 does not require the Commission to conclude that the project would have a "minimal" effect on the health, safety, or welfare of the inhabitants. The statute identifies that the company must prove the facility will not "substantially" impair the health, safety, or welfare of the inhabitants.

REQUESTS FOR PRODUCTION

1. All documents identified or referred to in your Answers to DRA's First Interrogatories to you. ***[Applicable Finding or Condition No.: all]***

a. The December 31, 2014 Quarterly Report can be accessed at http://www.puc.sd.gov/commission/dockets/hydrocarbonpipeline/2009/hp09-001/quarterlyreport123114.pdf. All Quarterly Reports submitted by Keystone are available in Docket HP09-001.

b. The Department of State's Final Supplemental Environmental Impact Statement, which can be accessed at: http://keystonepipeline-xl.state.gov/finalseis/

c. The Liaison Annual report, referenced in Staff's answer to Interrogatory No. 22 is also available in Docket HP09-001, and can be accessed at http://www.puc.sd.gov/commission/dockets/HydrocarbonPipeline/2009/HP09-001/liasonreport2014.pdf.

d. U.S. Department of Agriculture Rural Utilities Service's Big Bend to Witten 230-kv Transmission Project Environmental Assessment, which can be accessed at: http://www.wapa.gov/ugp/Environment/documents/BigBendtoWitten_EA_Nov_2014_Final.pdf

2. All documents and correspondence presented to any expert in connection with the above-captioned proceedings, or received from any expert, including but not limited to emails, letters, engagement documents, resumes, curriculum vitaes, reports, analysis, spreadsheets, schedules, and any drafts thereof. ***[Applicable Finding or Condition No.: all]***

a. OBJECTION. Staff objects to the request for all correspondence presented to

any expert or received from any expert. All correspondence was conducted by Staff's attorney of record and is, therefore, attorney work product.

b. OBJECTION. Staff objects to the request for production of engagement documents as not relevant to the proceedings. Subject to and without waiving its objection, staff provides the following subpoenas:

   i. Attachment 9, Subpoena of Brian Walsh

   ii. Attachment 10, Subpoena of Derric Iles

   iii. Attachment 11, Subpoena of Kimberly McIntosh

   iv. Attachment 12, Subpoena of Paige Olson

   v. Attachment 13, Subpoena of Tom Kirschenmann

c. Staff provides the following resumes and curriculum vitae, and will provide the same for its other witnesses as they are received:

   i. Attachment 1, Resume of Darren Kearney

   ii. Attachment 2, Resume of Kimberly McIntosh (not attached, as not been received by Staff)

   iii. Attachment 3, Resume of Brian Walsh

   iv. Attachment 4, Resume of Paige Olson

   v. Attachment 5, Resume of Tom Kirschenmann

   vi. Attachment 3, Resume of Daniel Flo

   vii. Attachment 7, Resume of Jenny Hudson (not attached, has not been received by Staff)

   viii. Attachment 8, Resume of Derric Iles

d. At this time, Staff has not received any reports, analysis, spreadsheets, schedules,

or drafts at this time.

3. The most recent resume or curriculum vitae of each expert whom you expect to call as an expert witness at the hearing before the Commission. ***[Applicable Finding or Condition No.: all]***

See previous answer.

4. The written reports of experts who are expected to testify on behalf of the PUC. ***[Applicable Finding or Condition No.: all]***

Staff has not received any reports at this time.

5. All correspondence between TransCanada or its Affiliates and the Commission or Commission Staff concerning the Project. ***[Applicable Finding or Condition No.: all]***

OBJECTION. Staff objects to this request on the grounds of attorney work product. All communications between Staff and TransCanada have been conducted by attorneys and are, therefore, the subject of attorney work product. Furthermore, Staff operates as a party, separate from the Commission and does not have access to or knowledge of Commission communications.

6. All documents concerning a change in routing of the Project between 2010 and the present date, including but not limited to, any parcel maps showing the precise location of the proposed Project through South Dakota. ***[Applicable Finding or Condition No.: Finding 16]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff asserts that it does not have this information and this time, but has requested updated maps and information from the Company.

7. All documents setting forth TransCanada's proposed construction schedule for the Project, and all contracts for construction of the proposed Project. ***[Applicable Finding or Condition No.: Finding 17]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff.

8. All documents showing location of power lines for pumping stations proposed for the Project, the location of proposed pumping stations and mainline valves for the Project in South Dakota, and including, but not limited to all communications between TransCanada's or its Affiliates' staff, consultants, advisors, or other parties and the PUC concerning location and operation of pumping stations, mainline valves, and the proposed conversion of valves to remote control operations. ***[Applicable Finding or Condition No.: Finding 20]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff submits that it does not have any relevant information.

9. All documents describing soil types and conditions along the currently-proposed Project route through South Dakota. ***[Applicable Finding or Condition No.: Finding 33]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets.

10. All documents describing, discussing, or setting forth plans for the Project to cross perennial streams and rivers, intermittent streams, and ephemeral streams in

South Dakota, including but not limited to all documents concerning the methodology used by TransCanada (and its Affiliates) or its agents in determining construction plans for the Project across such waterways. ***[Applicable Finding or Condition No.: Finding 41]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets.

11. All documents concerning the reduction in the length of the proposed Project potentially affecting High Consequence Areas. ***[Applicable Finding or Condition No.: Finding 50]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets.

12. All documents concerning TransCanada's (or its Affiliates') decision to withdraw its request to the PHMSA for a special permit referenced in Finding 60. ***[Applicable Finding or Condition No.: Finding 60]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets.

13. All documents containing information concerning construction/reclamation unit mapping referenced in Finding 80, including but not limited to the construction/reclamation unit mapping. ***[Applicable Finding or Condition No.: Finding 80]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff informs that it does not

have any information supplementary to what has been made publicly available in the dockets.

14. All documents, including but not limited to forecasts and projections of tax revenue accruing to the State of South Dakota should construction and operation of the Project commence, together with all documents reflecting payments to towns, cities, counties in South Dakota since 2008 along the operating portions of the original Keystone I pipeline. ***[Applicable Finding or Condition No.: Finding 107]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets.

15. All documents submitted to the PUC by TransCanada evidencing TransCanada's or its Affiliates' compliance efforts with applicable laws and regulations related to construction and operation of the Project. ***[Applicable Finding or Condition No.: Condition 1]***

See Quarterly Reports available in HP09-001. Staff has no additional documentation. Every document submitted by TransCanada is made publicly available in the appropriate docket.

16. All documents submitted to the PUC by TransCanada concerning TransCanada's or its Affiliates' efforts to obtain and comply with applicable permitting referenced in Condition 2, including but not limited to copies of any permits obtained. ***[Applicable Finding or Condition No.: Condition 2]***

See Quarterly Reports available in HP09-001. Staff has no additional documentation. Every document submitted by TransCanada is made publicly available in the appropriate docket.

17. All documents submitted by TransCanada to the PUC concerning TransCanada's or its Affiliates' compliance with the recommendations set forth the DOS's Final Environmental Impact Statement, including but not limited to documents discussing or concerning compliance with Section 106 of the National Historic Preservation Act. ***[Applicable Finding or Condition No.: Condition 3]***

See Quarterly Reports available in HP09-001. Staff has no additional documentation. Every document submitted by TransCanada is made publicly available in the appropriate docket.

18. All documents submitted by TransCanada to the PUC concerning or discussing proposed adjustments or deviations in the route of the Project, including but not limited to copies of notices to affected land owners. ***[Applicable Finding or Condition No.: Condition 6]***

See Quarterly Reports available in HP09-001. Staff has no additional documentation. Every document submitted by TransCanada is made publicly available in the appropriate docket.

19. All documents submitted by TransCanada to the PUC concerning the appointment of a public liaison officer by TransCanada for the Project, and all documents containing information regarding communications between the public liaison officer and landowners affected by the Project. ***[Applicable Finding or Condition No.: Condition 7]***

See Motion for Approval of Public Liaison Officer in docket HP09-001, http://www.puc.sd.gov/commission/dockets/hydrocarbonpipeline/2009/hp09-001/042710.pdf; Letter from Jerry Roitsch regarding the Liaison's Role,

http://www.puc.sd.gov/commission/dockets/hydrocarbonpipeline/2009/hp09-001/050410.pdf; and all Liaison Annual Reports submitted in docket HP09-001.

20. All documents containing information with respect to contacts or communications with state, county and municipal emergency response, law enforcement and highway, road and other infrastructure management agencies regarding the Project. ***[Applicable Finding or Condition No.: Condition 10]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets, see Quarterly Reports available in Docket HP09-001.

21. All documents containing information concerning TransCanada's or its Affiliates' efforts to comply with mitigation measures set forth in the Construction Mitigation and Reclamation Plan submitted to the Commission, regarding the KXL Pipeline and the existing Keystone I pipeline. ***[Applicable Finding or Condition No.: Condition 13]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets.

22. All documents containing information regarding consultations, including but not limited to communications, with Natural Resources Conservation Services ("NRCS") regarding development of construction/reclamation units ("Con/Rec Units"). ***[Applicable Finding or Condition No.: Condition 15]***

OBJECTION. The request attempts to shift the burden for production from the

Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets, see Quarterly Reports available in Docket HP09-001.

23. All documents containing information regarding consultations between TransCanada (or its Affiliates) and South Dakota Game, Fish and Parks. ***[Applicable Finding or Condition No.: Condition 20(c)]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets.

24. All documents submitted by TransCanada to the PUC describing the development of frac-out plans in areas where horizontal directional drilling will occur in connection with the Project, including but not limited to any frac-out plans developed. ***[Applicable Finding or Condition No.: Condition 21]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets.

25. All documents describing or containing information regarding TransCanada's or its Affiliates' efforts to comply with conditions regarding construction of the Project near wetlands, water bodies, and riparian areas, such documents including but not limited to compliance plans, construction plans, mitigation plans, and communications with any regulatory agency in such regard. ***[Applicable Finding or Condition No.: Condition 22]***

OBJECTION. The request attempts to shift the burden for production from the

Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets, see Quarterly Reports available in Docket HP09-001.

26. All documents containing or referencing adverse weather land protection plans developed in connection with the Project. ***[Applicable Finding or Condition No.: Condition 25]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets.

27. All documents that reference or identify private and new access roads to be used or required during construction of the Project. ***[Applicable Finding or Condition No.: Condition 28]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets.

28. All documents referencing agreements reached with landowners, including but not limited to any agreements reached with landowners modifying any requirements or conditions established by the Commission in connection with the Project. ***[Applicable Finding or Condition No.: Condition 30]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets.

29. All documents containing information regarding assessments performed in

connection with TransCanada's activities in "high consequence areas", including but not limited to documents referencing efforts by you to comply with 49 C.F.R. Part 195, and any communications or consultations with the South Dakota Geological Survey, the Department of Game Fish and Parks ("SDGFP"), affected landowners and government officials. ***[Applicable Finding or Condition No.: Condition 34]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets, see Quarterly Reports available in Docket HP09-001.

30. All documents where TransCanada has identified hydrologically sensitive areas as required by Condition Number 35. ***[Applicable Finding or Condition No.: Condition 35]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets, see Quarterly Reports available in Docket HP09-001.

31. All documents containing information regarding noise-producing facilities in connection with the Project, including but not limited to any studies conducted regarding noise levels, and any noise mitigation measures. ***[Applicable Finding or Condition No.: Condition 39]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets,

see Quarterly Reports available in Docket HP09-001.

32. All documents containing information regarding TransCanada's or its Affiliates' efforts to comply with protection and mitigation requirements of the US Fish and Wildlife Service ("USFWS") and SDGFP with respect to any endangered species. ***[Applicable Finding or Condition No.: Condition 41]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets, see Quarterly Reports available in Docket HP09-001.

33. All documents containing information or details regarding location of drain tiles, including but not limited to all documents containing information regarding the potential for drain tiles to operate as conduits for contaminants in connection with construction or operation of the Project. ***[Applicable Finding or Condition No.: Condition 42]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets.

34. All documents referencing or containing information concerning cultural or paleontological resources along the Project route, including but not limited to all documents identifying cultural and paleontological resources, consultations and communications with the Bureau of Land Management and Museum of Geology at the South Dakota School of Mines and Technology. ***[Applicable Finding or Condition No.: Condition 44]***

OBJECTION. The request attempts to shift the burden for production from the Company to Staff. Subject to and without waiving its objection, Staff informs that it does not have any information supplementary to what has been made publicly available in the dockets, see Quarterly Reports available in Docket HP09-001.

BEFORE THE PUBLIC UTILITIES COMMISSION
OF THE STATE OF SOUTH DAKOTA

IN THE MATTER OF THE PETITION OF TRANSCANADA KEYSTONE PIPELINE, LP FOR ORDER ACCEPTING CERTIFICATION OF PERMIT ISSUED IN DOCKET HP09-001 TO CONSTRUCT THE KEYSTONE XL PIPELINE	**STAFF'S RESPONSE TO INTERROGATORIES AND REQUESTS FOR PRODUCTION OF DOCUMENTS FROM PAUL SEAMANS** **HP14-001**

COMES NOW, Commission Staff by and through its attorney of record, Kristen N. Edwards, and hereby provides the following response to Paul Seamans' Interrogatories and Requests for Production of Documents.

Dated this 10th day of March, 2015.

Kristen N. Edwards
Staff Attorney
South Dakota Public Utilities Commission
500 East Capitol Avenue
Pierre, SD 57501

2-1) What I would like to know is whether the Emergency Response Plan (ERP) and the Integrity Management Plan (IMP) for the Keystone XL and Keystone 1 are considered confidential as TransCanada claims they are. As part of discovery I have asked TransCanada to disclose where the High Consequence Areas (HCA's) are located as well as asking to see the ERP and IMP. TransCanada claims that "the PUC's jurisdiction over the emergency response plan is preempted by federal law. See 49 C.F.R. Part 194; 49 U.S.C. 60104(c)".

Response: While not specifically mandated to be kept confidential by the referenced sections of code, the Emergency Response Plan and the Integrity Management Plan contain information and data that may be considered confidential and/or proprietary by TransCanada.

2-2) One incident that started me to thinking about this confidentiality issue is that at the Dakota Access pipeline meeting in Iroquois I asked Joey Malmoud if their ERP would be available to the public. Joey said that yes, it would be available to the public. Here is Dakota Access saying that their ERP will be available for public viewing and on the other hand TransCanada claims the PHMSA requires that their ERP be kept confidential and is proprietary. Is the ERP required by PHMSA to be confidential or is it, or portions of it, available for the public to view?

Response: The Emergency Response Plan required by 195.402 (d) Abnormal Operation and the Response Plans for Onshore Oil Pipelines required by CFR Part 194 contain information and data that may be considered confidential and/or proprietary by TransCanada.

2-3) If the PUC determines that the ERP is accessible to the public then I would like to see the ERP for Keystone 1 as I realize that the ERP for the Keystone XL does not need to be filed until the pipeline is close to operational. I am willing to go through the necessary steps to obtain access to confidential information as required in ARSD 20:10:01:43.

Response: All information submitted to the PUC regarding Keystone I's ERP is available in 7.0 of the company's Quarterly Report. For the last Quarterly Report filed by TransCanada for Keystone I, view the report at http://www.puc.sd.gov/commission/dockets/HydrocarbonPipeline/2007/HP07-001/4thquarterly2010.pdf.
Furthermore, the final version of the Keystone Pipeline Emergency Response Plan will be amended to include Keystone XL. A redacted version of the ERP is available in Appendix I of the Final Supplemental Environmental Impact Study, which is publicly available.

STATE OF SOUTH DAKOTA)
)SS.
COUNTY OF HUGHES)

I, Kristen N. Edwards, attorney for Staff of the Public Utilities Commission, being of legal age, being first duly sworn upon oath, hereby swear or affirm that the forgoing answers and information provided are true and correct to the best of my knowledge.

Kristen Edwards

Subscribed and sworn to before me this 10th day of March, 2015.

Forward Looking Information and Non-GAAP Measures

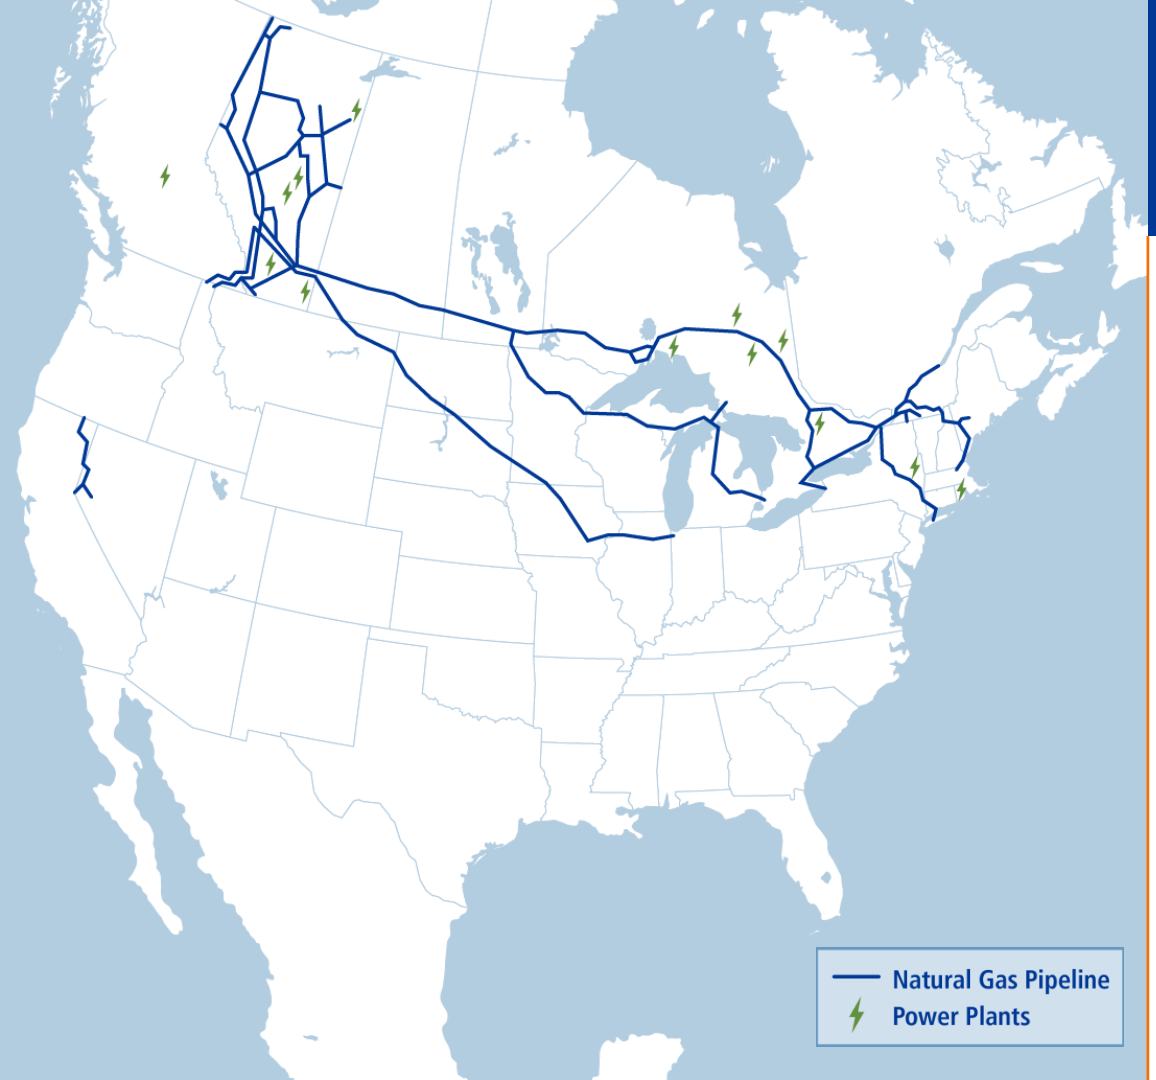
This presentation includes certain forward looking information to help current and potential investors understand management's assessment of our future plans and financial outlook, dividend prospects and our future prospects overall. Statements that are forward-looking are based on certain assumptions and on what we know and expect today and generally include words like anticipate, expect, believe, may, will, should, estimate or other similar words. Forward-looking statements do not guarantee future performance. Actual events and results could be significantly different because of assumptions, risks or uncertainties related to our business or events that happen after the date of this presentation. Our forward-looking information is based on the following key assumptions: inflation rates, commodity prices and capacity prices, timing of financings and hedging, regulatory decisions and outcomes, foreign exchange rates, interest rates, tax rates, planned and unplanned outages and the use of our pipeline and energy assets, integrity and reliability of our assets, access to capital markets, anticipated construction costs, schedules and completion dates, acquisitions and divestitures.

Our forward looking information is subject to risks and uncertainties, including but not limited to: our ability to successfully implement our strategic initiatives and whether they will yield the expected benefits, the operating performance of our pipeline and energy assets, economic and competitive conditions in North America and globally, the availability and price of energy commodities and changes in market commodity prices, the amount of capacity sold and rates achieved in our pipeline businesses, the amount of capacity payments and revenues we receive from our energy business, regulatory decisions and outcomes, outcomes of legal proceedings, including arbitration and insurance claims, performance of our counterparties, changes in the political environment, changes in environmental and other laws and regulations, construction and completion of capital projects, labour, equipment and material costs, access to capital markets, interest and foreign exchange rates, weather, cyber security and technological developments. You can read more about these risks and others in our most recent Quarterly Report to Shareholders and 2014 Annual Report filed with Canadian securities regulators and the U.S. Securities and Exchange Commission (SEC) and available at www.transcanada.com.

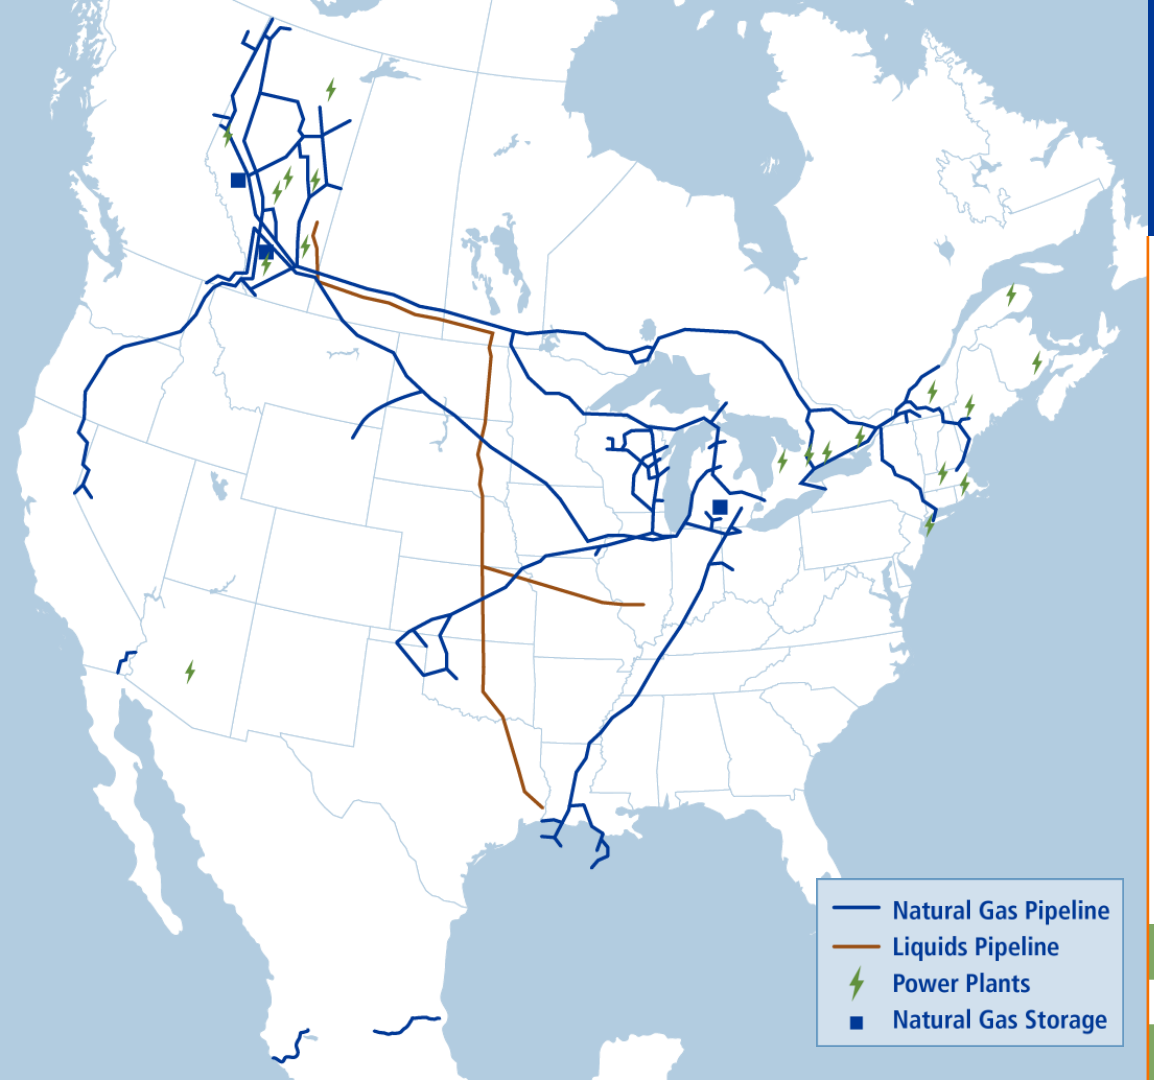
As actual results could vary significantly from the forward-looking information, you should not put undue reliance on forward-looking information and should not use future-oriented information or financial outlooks for anything other than their intended purpose. We do not update our forward-looking statements due to new information or future events, unless we are required to by law.

This presentation contains reference to certain financial measures (non-GAAP measures) that do not have any standardized meaning as prescribed by U.S. generally accepted accounting principles (GAAP) and therefore may not be comparable to similar measures presented by other entities. These non-GAAP measures may include Comparable Earnings, Comparable Earnings per Share, Earnings Before Interest, Taxes, Depreciation and Amortization (EBITDA), Comparable EBITDA, and Funds Generated from Operations. Reconciliations to the most closely related GAAP measures are included in our most recent Quarterly Report to Shareholders filed with Canadian securities regulators and the SEC and available at www.transcanada.com.

TransCanada in 2000



- Asset Base: $26 billion
- Comparable EBITDA: $2.5 billion



TransCanada Today

- One of North America's Largest Natural Gas Pipeline Networks
  - 68,000 km (42,000 mi) of pipeline
  - 368 Bcf of storage capacity
  - 14 Bcf/d or 20% of continental demand
- Premier Liquids Pipeline System
  - 4,250 km (2,600 mi) of pipeline
  - 530,000 bbl/d or 18% of Western Canadian production
- Largest Private Sector Power Generator in Canada
  - 19 power plants, 10,900 MW
- Enterprise Value ~ $73 billion

Unparalleled Portfolio of Complementary Energy Infrastructure Assets

Realizing Our Vision

Our Priorities

- Maximize value of our $64 billion asset base
- Complete $46 billion capital program
- Cultivate a portfolio of low-risk growth opportunities
- Maintain financial strength and flexibility

Deliver Superior Long-Term Returns to Shareholders

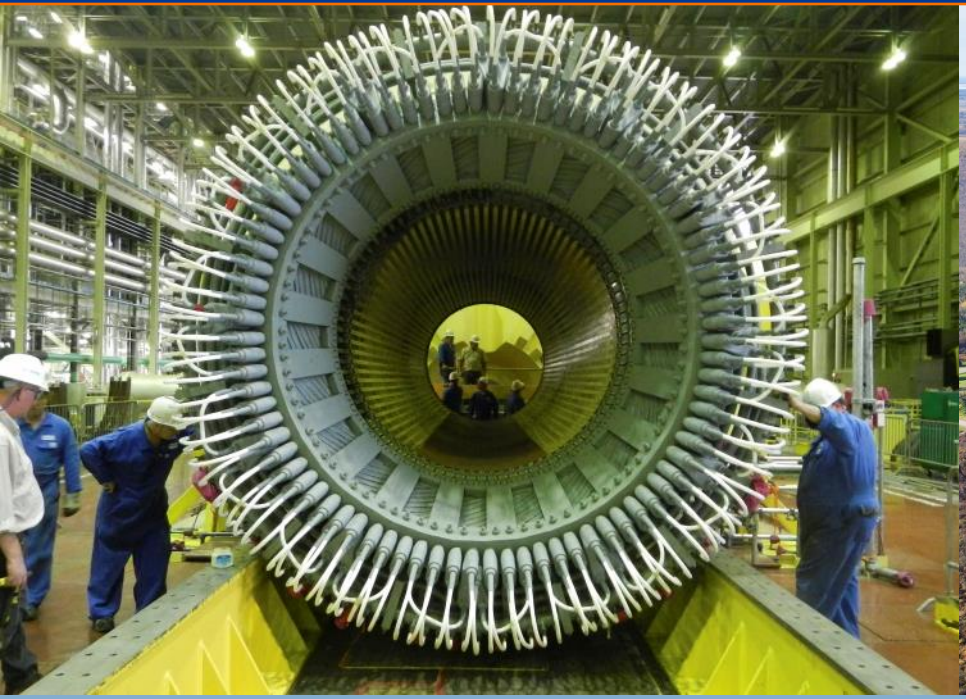
Maximizing the Value of our Base Business

Long-term stability for Canadian Mainline and ANR Pipeline

Maximizing the Value of our Base Business

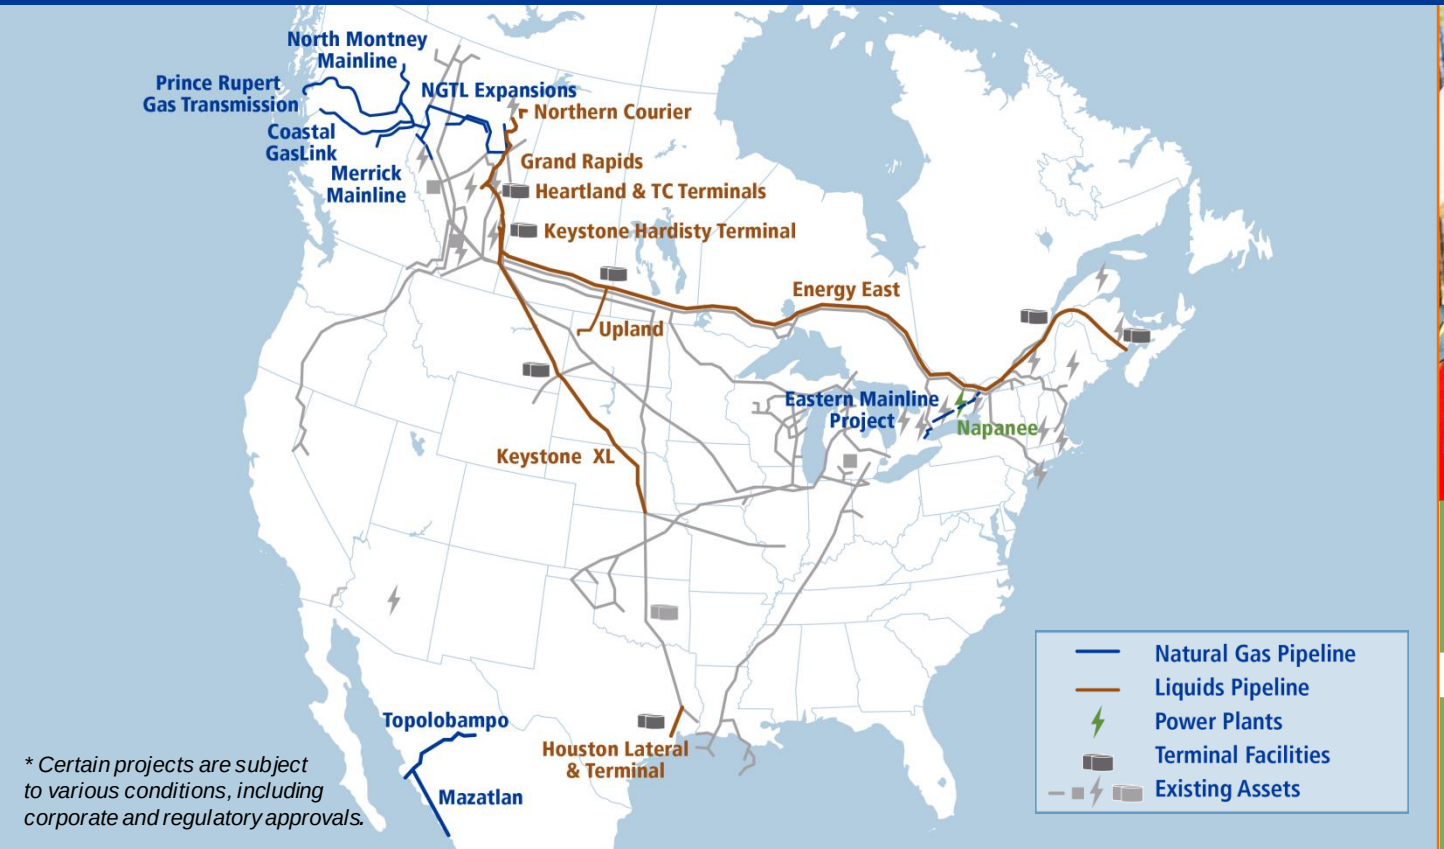
Keystone Pipeline EBITDA surpassed $1 billion

Maximizing the Value of our Base Business



Bruce Power and Ontario Solar online

$46 Billion Portfolio of Commercially Secured Projects*

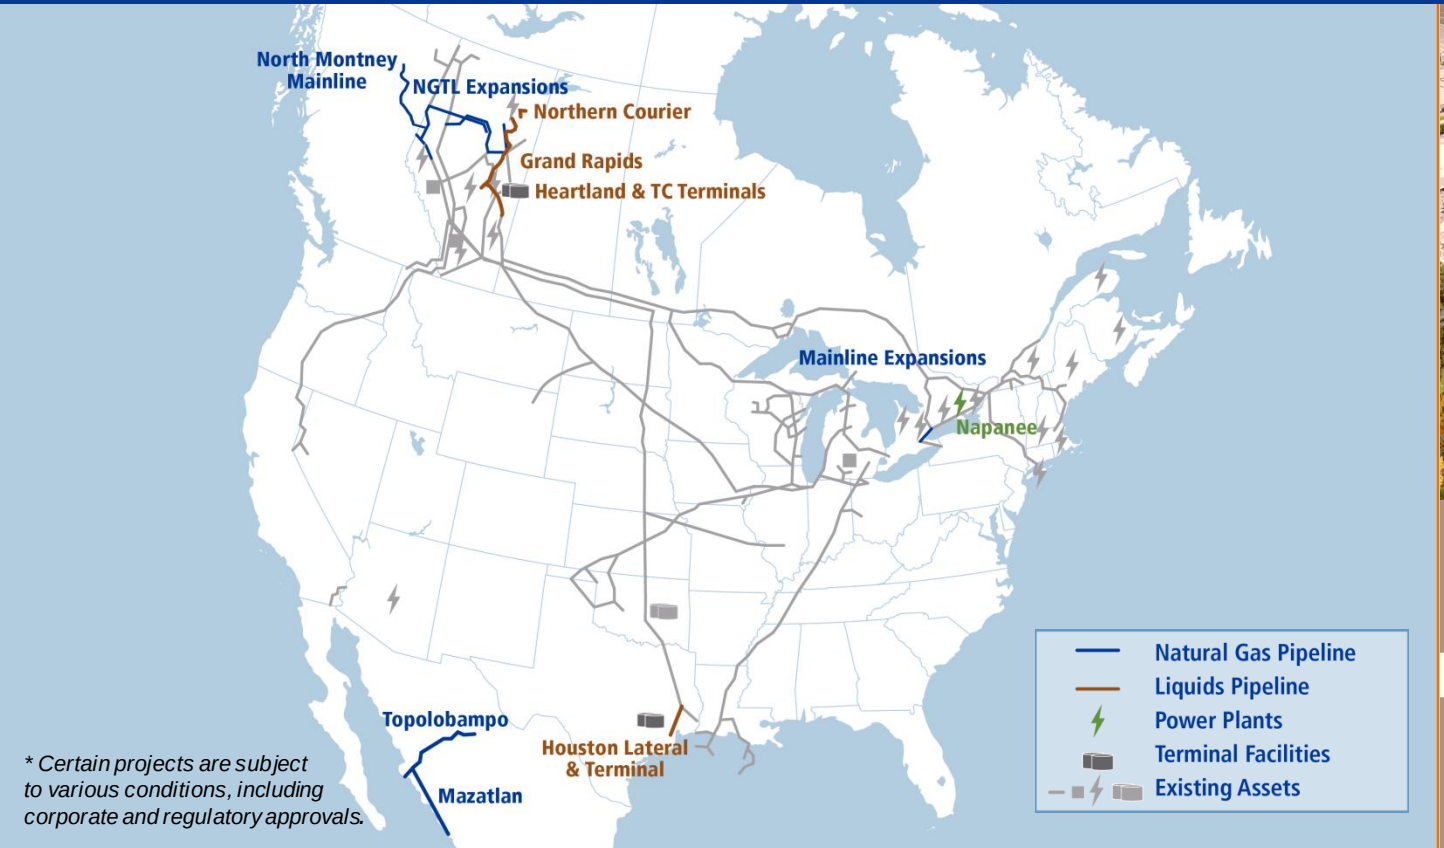


Predictable & stable earnings and cash flow for decades

013469

** Certain projects are subject to various conditions, including corporate and regulatory approvals.*

$12 Billion of Small to Medium-Sized Projects Drive Growth*

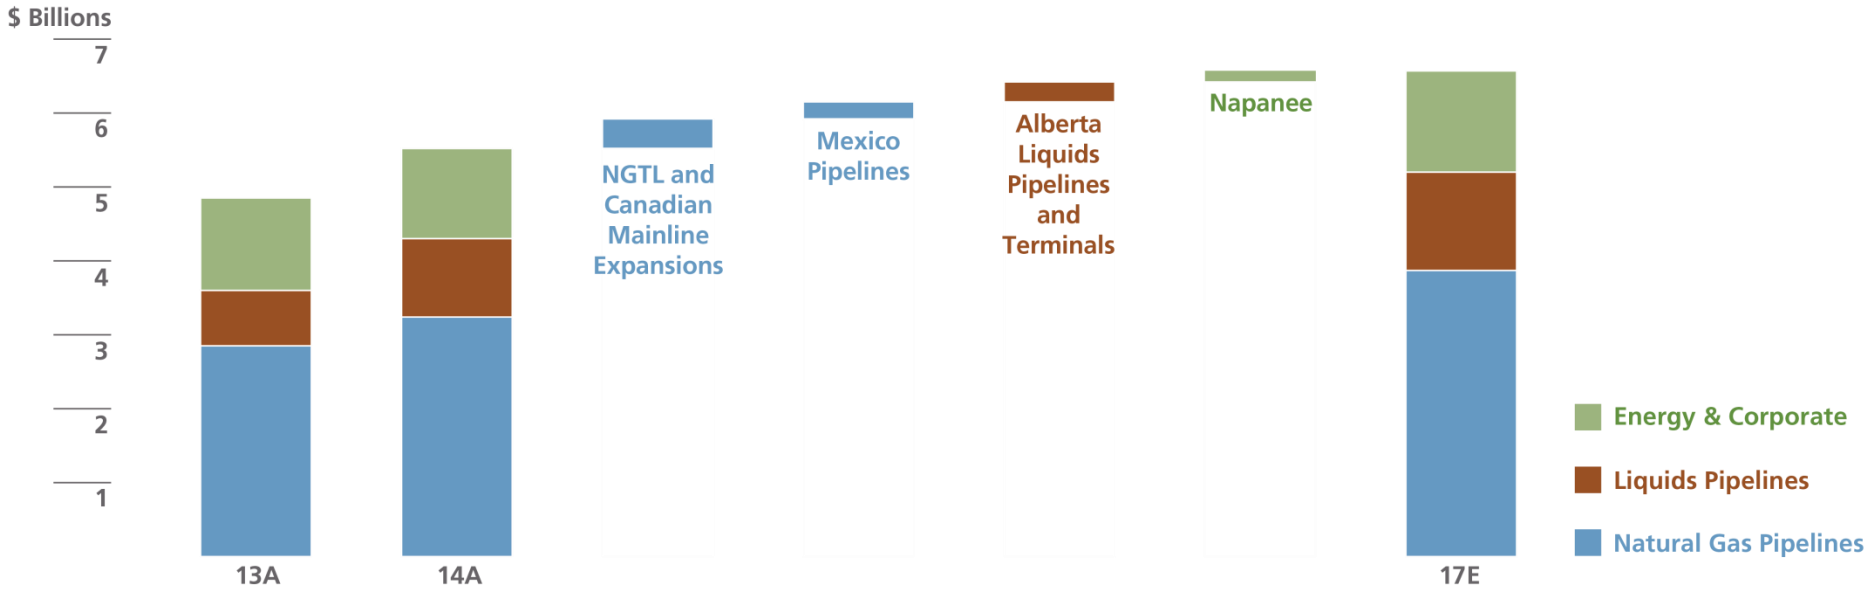


Projects expect to be completed by the end of 2017

** Certain projects are subject to various conditions, including corporate and regulatory approvals.*

013470

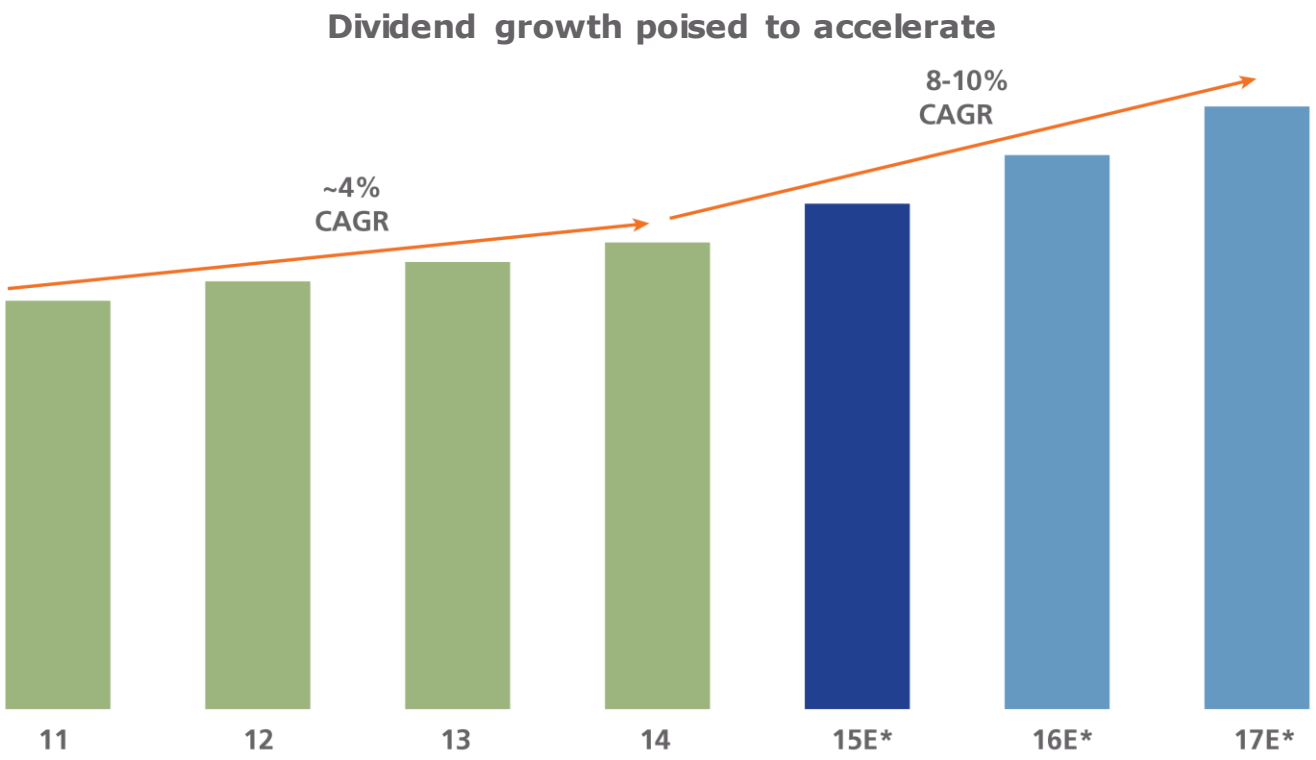
EBITDA Growth 2013A – 2017E*



* TransCanada share in billions of dollars. Certain projects are subject to various conditions including corporate and regulatory approvals. Includes existing assets, non-controlling interests in U.S. Natural Gas Pipelines and full year EBITDA contribution from $12 billion of commercially secured projects expected to be in service by the end of 2017.

~8% CAGR in EBITDA through 2017

Dividend Outlook



* *Dividends are declared at the discretion of the Board of Directors*

Equates to ~35% of cash flow

013472

Strong Platform for Future Growth

- North America requires new and improved energy infrastructure
- Secured $34 billion in large-scale projects
- Numerous additional opportunities in our core markets
- Advancing growth plans will deliver exceptional value for shareholders

Natural Gas Pipelines Growth Opportunities

- Advance $13 billion of large-scale commercially secured projects*
- Leverage NGTL's strong competitive position
- Connect growing Marcellus/Utica gas to market
- Capitalize on build-out of Mexico infrastructure

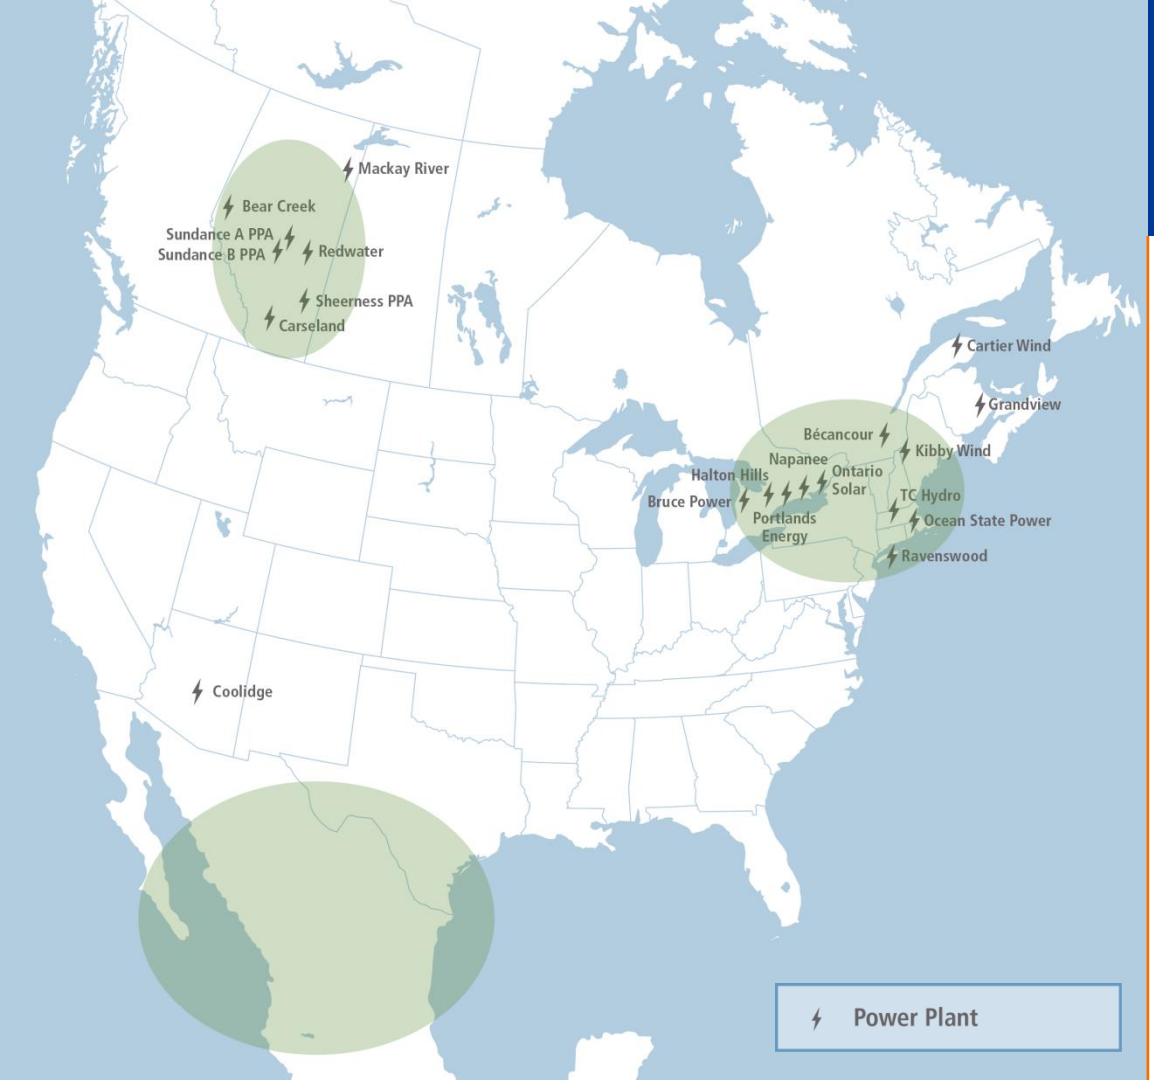
** Certain projects are subject to various conditions, including corporate and regulatory approvals.*

Liquids Pipelines Growth Opportunities

- Advance $21 billion of large-scale commercially secured projects*
- Connect growing Western Canadian and U.S. oil supply to key refining markets
- Capture Alberta regional liquids infrastructure opportunities
- Extend market connectivity

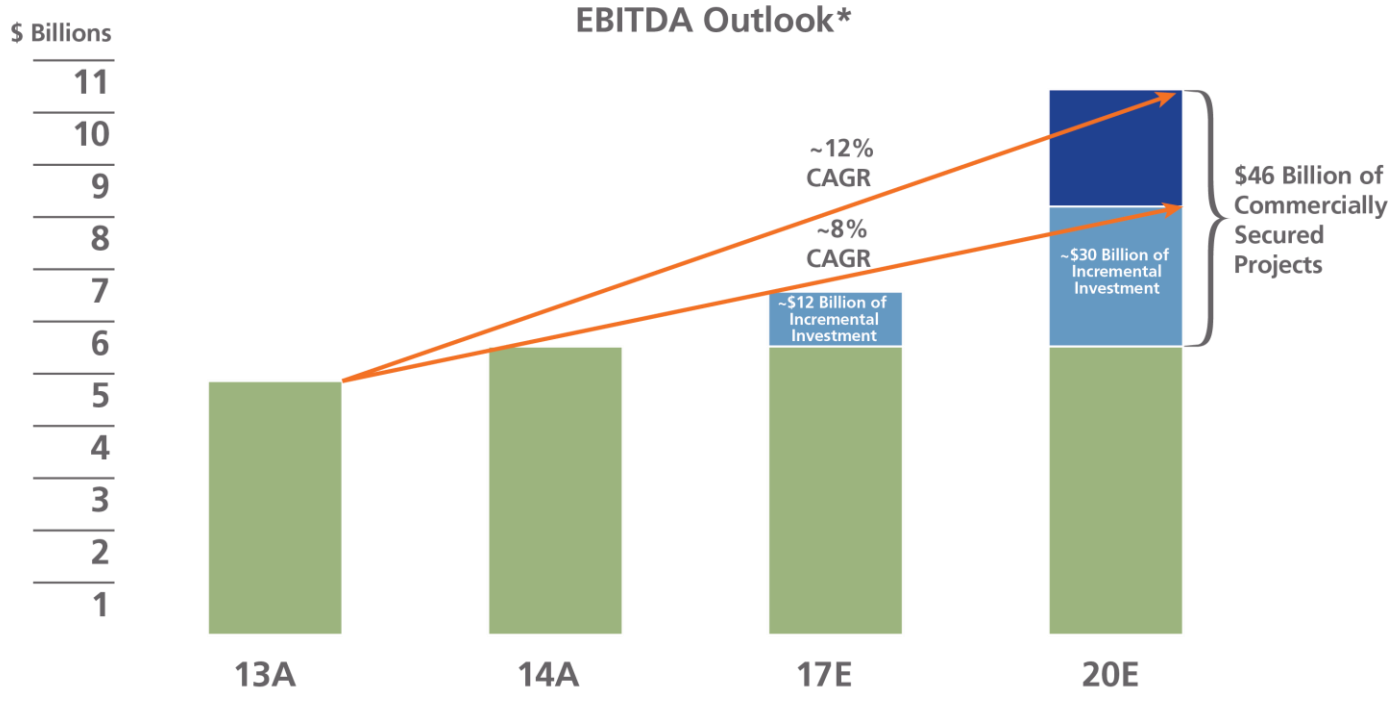
** Certain projects are subject to various conditions, including corporate and regulatory approvals.*

Energy Growth Opportunities



- Bruce Power refurbishments
- Renewables: wind, solar and hydro
- Natural gas-fired generation
- Mexico power
- Repowering opportunities

Deliver Significant Growth

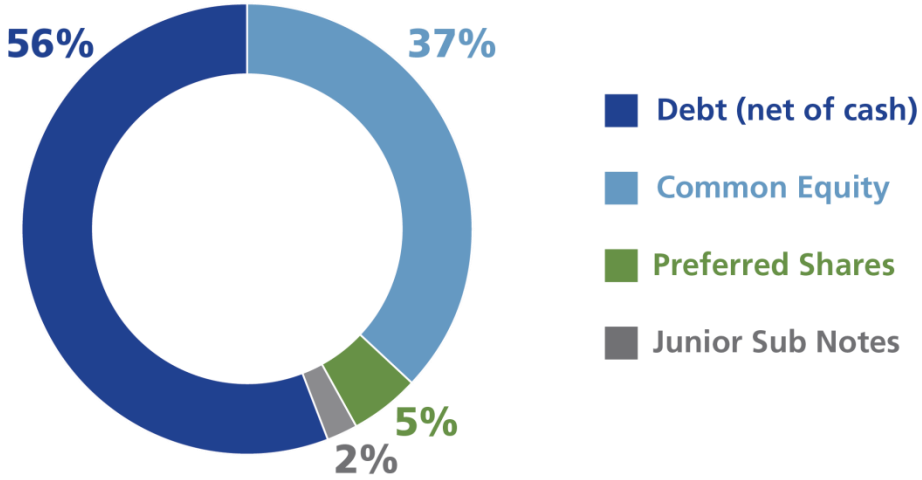


Predictable and sustainable EBITDA growth

* *Includes existing assets, non-controlling interests in U.S. natural gas pipelines and $46 billion of commercially secured projects expected to be in service by 2020, subject to certain conditions including corporate and regulatory approvals.*

Financial Flexibility Enhances Long-Term Shareholder Value

Strong Financial Position*
Supports Access to Significant Capital at Attractive Rates



Funding Options Available:

- Internally generated cash flow
- Senior debt
- Preferred shares and hybrid securities
- Portfolio management including asset sales to TC PipeLines, LP
- Partners/Project Finance
- Dividend reinvestment plan
- Discrete common equity issue

* *At March 31, 2015. Common equity includes non-controlling interests in TC PipeLines, LP and Portland.*

PREFACE

This document is a revised edition of the Engineering and Geoscience Professions Act, Regulations (including the Code of Ethics) and By-Laws, incorporating all amendments up to March 2012. The Act and Regulations are printed with the permission of the Government of the Province of Alberta.

The Act, (Revised Statutes of Alberta. Chapter E-11.1), is a government consolidation of the 1981 Act, the 1984 Amendment Act and other subsequent amendments. The amendments proclaimed in 2012 created APEGA in the place of APEGGA. The General Regulation is a consolidation of the 1981 Regulation and amendments to the Regulation approved in December 1985, July 1990, April 1996, July 1999 (AR 150/99), February 2003 (AR 37/2003), April 2007 (AR 72/2007), October 2009 (AR 281/2009) and March 2012 (AR 55/2012). A regulation providing for registration of professional technologists (AR 283/2009) was amended by AR 57/2012, and a regulation respecting the operation of ASET (AR 282/2009) was amended by AR 56/2012. All persons making use of this consolidation are reminded that it has no legislative sanction, that the amendments have been embodied for convenience of reference only, and that the original Act, Regulations and amending Acts and Regulations be consulted for all purposes of interpreting and applying the law.

The By-Laws incorporate the amendments which were approved at the APEGGA Annual General Meetings of June 1983, June 1987, April 1991, April 1993, April 1996, April 1997, April 1998, April 1999, April 2000, April 2001, April 2002, April 2004, April 2005, April 2009, and April 2010 and at a special meeting of members in October, 2009. Consequential amendments to Bylaws taking effect in March 2012 with the latest amendments to Act and Regulations are included. These are the latest amendments.

An index is provided for convenient reference to any or all of the three documents.

HER MAJESTY, by and with the advice and consent of the Legislative Assembly of Alberta, enacts as follows:

Definitions

1 In this Act,

(a) "Appeal Board" means the Appeal Board established under section 18;

(a.1) "ASET Council" means the Council continued under section 87;

(b) "Association" means the Association of Professional Engineers and Geoscientists of Alberta;

(c) "Board of Examiners" means the Board of Examiners established under section 30;

(d) "certificate holder" means

(i) a joint firm, and

(ii) a restricted practitioner;

(e) "Council" means the Council of the Association;

(f) "Court" means the Court of Queen's Bench;

(g) "Discipline Committee" means the Discipline Committee established under section 45;

(h) "Investigative Committee" means the Investigative Committee established by the Council pursuant to section 46;

(i) "Joint Board" means the Joint Board of Practice under section 1 of Schedule 8 to the Government Organization Act;

(i.1) "Joint Councils Committee" means the committee established by section 1.1;

(j) "joint firm" means a firm to which a certificate of authorization has been issued under section 35;

(k) "licensee" means an individual who holds a licence under this Act but does not include a professional licensee;

(l) "member of the Association" means a person who is registered as a professional member or a member of a class or category of membership established under this Act;

(m) "member of the public" means, in sections 14, 15 and 30, a person who is

(i) a Canadian citizen or who is lawfully admitted to Canada for permanent residence,

(ii) a resident of Alberta, and

(iii)not a professional member of the Association;

(n) "member-in-training" means engineer-in-training or geoscientist-in-training, as the case may be;

(o) "Minister" means the Minister determined under section 16 of the *Government Organization Act* as the Minister responsible for this Act;

(p) "permit holder" means a partnership or other association of persons or a corporation that holds a permit under this Act but does not include an ASET permit holder as defined in section 86.4;

(q) "practice of engineering" means

(i) reporting on, advising on, evaluating, designing, preparing plans and specifications for or directing the construction, technical inspection, maintenance or operation of any structure, work or process

(A) that is aimed at the discovery, development or utilization of matter, materials or energy or in any other way designed for the use and convenience of humans, and0

(B) that requires in that reporting, advising, evaluating, designing, preparation or direction the professional application of the principles of mathematics, chemistry, physics or any related applied subject, or

(ii) teaching engineering at a university;

(r)"practice of geoscience" means

(i) reporting, advising, evaluating, interpreting, processing, geoscientific surveying, exploring, classifying reserves or examining related to any activity

(A) that relates to the earth sciences or the environment,

(B) that is aimed at the discovery or development of oil, natural gas, coal, metallic or non-metallic minerals, precious stones, other natural resources or water or that is aimed at the investigation of surface or subsurface conditions of the earth, and

(C) that requires, in that reporting, advising, evaluating, interpreting, processing, geoscientific surveying, exploring, classifying reserves or examining, the professional application of the principles of mathematics, chemistry, physics or biology through the application of the principles of geoscience,

or

(ii) teaching geoscience at a university;

(s) repealed 2011 c3 s3;

(t) "Practice Review Board" means the Practice Review Board established under section 15;

(u) "profession" means the profession of engineering or geoscience, as the case may be;

(v) "professional engineer" means an individual who holds a certificate of registration to engage in the practice of engineering under this Act but does not include

(i) a professional licensee (engineering), or

(ii) a professional technologist as defined in section 86.4(m);

(w) "professional geoscientist" means an individual who holds a certificate of registration to engage in the practice of geoscience under this Act but does not include

(i) a professional licensee (geoscience), or

(ii) a professional technologist as defined in section 86.4(m);

(x) repealed 2011 c3 s3;

(x.1) "professional licensee" means a professional licensee (engineering) or a professional licensee (geoscience);

(x.2) "professional licensee (engineering)" means an individual who holds a certificate of registration and an annual licence to engage in the practice of engineering within the scope of practice specified by the Board of Examiners;

(x.3) "professional licensee (geoscience)" means an individual who holds a certificate of registration and an annual licence to engage in the practice of geoscience within the scope of practice specified by the Board of Examiners;

(x.4) repealed 2011 c3 s3;

(y) "professional member" means a professional engineer or professional geoscientist;

(z) "Registrar" means the Registrar appointed under section 13;

(aa) "restricted practitioner" means a registered architect under the *Architects Act* who holds a certificate of authorization under this Act.

RSA 2000 cE-11 s1;2007 c13 s2;2011 c3 s3

Joint Councils Committee

1.1(1) There is established a Joint Councils Committee composed of an equal number of members from the Executive Committees of the Council and ASET Council appointed respectively by the Council and ASET Council.

(2) The purposes of the Joint Councils Committee are to

(a) discuss proposed amendments to this Act and new or proposed amendments to any regulations made under this Act;

(b) provide a forum for discussion, collaboration and co-ordination with respect to matters of mutual interest to the Association and ASET;

(c) perform any other function prescribed by this Act or any regulation made under this Act, or by agreement of the Council and ASET Council.

(3) The Joint Councils Committee shall meet and its procedure shall be governed by rules established by agreement of the Council and ASET Council.

(4) The Council and ASET Council may, by agreement, alter the composition of the Joint Councils Committee described in subsection (1).

2007 13 s3;2011 c3 s4

Part 1
Scope of Practice

Exclusive scope of the practice of engineering

2(1) Except as otherwise provided in this Act, no individual, corporation, partnership or other entity, except a professional engineer, a licensee so authorized in the licensee's licence, a permit holder so authorized in its permit or a certificate holder so authorized in the certificate holder's certificate, shall engage in the practice of engineering.

(2) No individual, corporation, partnership or other entity, shall engage in both the practice of engineering and the practice of architecture as defined in the *Architects Act*, or hold out that it is entitled to engage in both the practice of engineering and the practice of architecture unless it holds a certificate of authorization under this Act or the *Architects Act* permitting it to do so.

(3) A professional engineer, licensee, permit holder or joint firm may engage in the practice of surveying other than land surveying as defined in the *Land Surveyors Act*.

(4) Subsection (1) does not apply to the following:

(a) a person engaged in the execution or supervision of the construction, maintenance, operation or inspection of any process, system, work, structure or building in the capacity of contractor, superintendent, foreman or inspector or in any similar capacity, when the process, system, work, structure or building has been designed by and the execution or supervision is being carried out under the supervision and control of a professional engineer or licensee;

(b) a person engaged in the practice of engineering as an engineer-in-training or engineering technologist in the course of being employed or engaged and supervised and controlled by a professional engineer, licensee, permit holder or certificate holder;

(c) repealed 2007 c13 s4;

(d) a person who in accordance with an Act or regulation in respect of mines, minerals, pipelines, boilers and pressure vessels, building codes or safety codes for buildings is engaged in any undertaking or activity required under or pursuant to that Act or the regulations under that Act;

013492

(e) a person who, on the person's own property and for the person's sole use or the use of the person's domestic establishment, carries out any work that does not involve the safety of the public;

(f) a member of the Canadian Forces while actually employed on duty with the Forces;

(g) a person engaged or employed by a university whose practice of the profession consists exclusively of teaching engineering at the university.

(5) A restricted practitioner is not authorized by the operation of subsection (1) to engage in the practice of engineering beyond the scope of the practice that is specified in the register.

(6) Subsection (1) does not apply to a person if the person engages in

(a) planning, designing or giving advice on the design of or on the erection, construction or alteration of or addition to,

(b) preparing plans, drawings, detail drawings, specifications or graphic representations for the design of or for the erection, construction or alteration of or addition to, or

(c) inspecting work or assessing the performance of work under a contract for the erection, construction or alteration of or addition to

a building set out in subsection (7).

(7) The buildings referred to in subsection (6) are the following:

(a) a building, 3 storeys or less in height, for assembly occupancy or institutional occupancy that,

(i) in the case of a single storey building, has a gross area of 300 square metres or less,

(ii) in the case of a 2 storey building, has a gross area of 150 square metres or less on each floor, or

(iii) in the case of a 3 storey building, has a gross area of 100 square metres or less on each floor;

(b) a building for residential occupancy that

(i) is a single family dwelling, or

(ii) is a multiple family dwelling, containing 4 dwelling units or less;

(c) a building, 3 storeys or less in height, for residential occupancy as a hotel, motel or similar use that,

(i) in the case of a single storey building, has a gross area of 400 square metres or less,

(ii) in the case of a 2 storey building, has a gross area of 200 square metres or less on each floor, or

(iii) in the case of a 3 storey building, has a gross area of 130 square metres or less on each floor;

(d) a building, 3 storeys or less in height, for warehouse, business and personal services occupancy, for mercantile occupancy or for industrial occupancy that,

(i) in the case of a single storey building, has a gross area of 500 square metres or less,

(ii) in the case of a 2 storey building, has a gross area of 250 square metres or less on each floor, or

(iii) in the case of a 3 storey building, has a gross area of 165 square metres or less on each floor;

(e) a building that is a farm building not for public use;

(f) a relocatable industrial camp building.

RSA 2000 cE-11 s2;2007 c13 s4

013493

Exclusive use of name engineer

3(1) No individual, corporation, partnership or other entity, except a professional engineer, licensee or permit holder entitled to engage in the practice of engineering, shall

(a) use

(i) the title "professional engineer", the abbreviation "P. Eng." or any other abbreviation of that title,

(i.1)repealed 2011 c3 s5,

(ii) the word "engineer" in combination with any other name, title, description, letter, symbol or abbreviation that represents expressly or by implication that the individual, corporation, partnership or other entity is a professional engineer, licensee or permit holder,

or

(b) represent or hold out, expressly or by implication, that the individual, corporation, partnership or other entity

(i) is entitled to engage in the practice of engineering, or

(ii) is a professional engineer, licensee or permit holder.

(2) No individual, corporation, partnership or other entity, except a professional engineer, licensee or permit holder entitled to engage in the practice of engineering, shall affix the stamp or seal of a professional engineer or licensee or the permit number of a permit holder or allow that stamp, seal or permit number to be affixed to a plan, drawing, detail drawing, specification or other document or a reproduction of any of them unless

(a) that plan, drawing, detail drawing, specification, other document or reproduction was prepared by or under the supervision and control of, and

(b) the stamp, seal or permit number is affixed with the knowledge and consent or in accordance with the direction of

the professional engineer or licensee to whom or the permit holder to which the stamp, seal or permit number was issued.

(3) Notwithstanding subsection (2), a professional engineer, licensee or permit holder may affix a stamp, seal or permit number, as the case may be, to a plan, drawing, detail drawing, specification, other document or reproduction prepared by other persons if the professional engineer, licensee or permit holder completes a thorough review of and accepts professional responsibility for that plan, drawing, detail drawing, specification, other document or reproduction.

RSA 2000 cE-11 s3;2007 c13 s5;2011 c3 s5

Holding out by joint firm

4 A joint firm

(a) may hold itself out as "engineers and architects" or "architects and engineers" only if it has both professional engineers and registered architects as partners or shareholders in an arrangement that is satisfactory to the Council and the council of The Alberta Association of Architects;

(b) shall not hold itself out as "engineers and architects" or "architects and engineers" if the registered architects or professional engineers are employees only and not partners or shareholders, or if the partnership or shareholding arrangement is not satisfactory to the Council or the council of The Alberta Association of Architects.

1981 cE-11.1 s4

Exclusive scope of the practice of geoscience

5(1) Subject to subsection (2), no individual, corporation, partnership or other entity, except a professional geoscientist, a licensee so authorized in the licensee's licence or a permit holder so authorized in the permit, shall engage in the practice of geoscience.

(2) Subsection (1) does not apply to the following:

013494

(a) a person engaged in the execution or supervision of the construction, maintenance, operation or inspection of any geoscientific investigation, process, system, study, work or instrumentation in the capacity of contractor, superintendent, foreman or inspector, or in any similar capacity, when the investigation, process, system, study, work or instrumentation has been designed by, and the execution or supervision is being carried out under the supervision and control of, a professional geoscientist or licensee;

(b) a person engaged in the practice of geoscience as a geoscientist-in-training or geoscience technologist in the course of being employed or engaged and supervised and controlled by a professional geoscientist, licensee or permit holder;

(c) a person who, as a prospector, is engaged in any activities that are normally associated with the business of prospecting;

(d) a member of the Canadian Forces while actually employed on duty with the Forces;

(e) a person engaged in conducting a routine geoscientific survey or preparing a routine geoscientific report where the specifications and standards for the survey or report have been prepared or approved by a professional geoscientist or licensee;

(f) a person engaged in the routine reduction or plotting of geoscientific data under the supervision and control of a professional geoscientist or licensee;

(g) a person engaged in the routine operation, maintenance or repair of geoscience equipment or facilities;

(h) a person engaged or employed by a university whose practice of the profession consists exclusively of teaching geoscience at the university.

RSA 2000 cE-11 s5;2007 c13 s6;2011 c3 s6

Exclusive use of name geoscientist

6(1) No individual, corporation, partnership or other entity, except a professional geoscientist or a licensee or permit holder entitled to engage in the practice of geoscience, shall

(a) use

(i) the title "professional geoscientist", the abbreviation "P. Geo." or any other abbreviation of that title,

(ii) the word "geoscientist" in combination with any other name, title, description, letter, symbol or abbreviation that represents expressly or by implication that the individual, corporation, partnership or other entity is a professional geoscientist, licensee or permit holder,

or

(b) represent or hold out, expressly or by implication, that the individual, corporation, partnership or other entity

(i) is entitled to engage in the practice of geoscience, or

(ii) is a professional geoscientist, licensee or permit holder.

(2) No individual, corporation, partnership or other entity, except a professional geoscientist or a licensee or permit holder entitled to engage in the practice of geoscience, shall affix the stamp or seal of a professional geoscientist or licensee or the permit number of a permit holder or allow that stamp, seal or permit number to be affixed to a map, geoscientific cross-section, specification, report or other document or a reproduction of any of them unless

(a) that map, geoscientific cross-section, specification, report, other document or reproduction was prepared by or under the supervision and control of, and

(b) the stamp, seal or permit number is affixed with the knowledge and consent or in accordance with the direction of

the professional geoscientist or licensee to whom or the permit holder to which the stamp, seal or permit number was issued.

013495

(3) Notwithstanding subsection (2), a professional geoscientist, licensee or permit holder may affix a stamp, seal or permit number, as the case may be, to a map, geoscientific cross-section, specification, report, other document or reproduction prepared by other persons if the professional geoscientist, licensee or permit holder completes a thorough review of and accepts professional responsibility for that map, geoscientific cross-section, specification, report, other document or reproduction.

RSA 2000 cE-11 s6;2007 c13 s7;2011 c3 s6

7 and **8** Repealed 2011 c3 s6.

Injunction

9 The Court, on application by the Council, may grant an injunction enjoining any person from doing any act or thing that contravenes this Part, notwithstanding any penalty that may be provided by this Act or the regulations in respect of that act or thing.

RSA 2000 cE-11 s9;2009 c53 s59

Part 2
Association

Association of Professional Engineers and Geoscientists

10(1) The Association of Professional Engineers, Geologists and Geophysicists of Alberta is continued as a corporation with the name "Association of Professional Engineers and Geoscientists of Alberta".

(2) The abbreviated form of the name of the Association is A.P.E.G.A. or APEGA.

(3) No person other than the Association shall use the abbreviated form of the name of the Association or any other abbreviation alone or in combination with any other word or name in a way that represents expressly or by implication that the person is a member of or connected in any way with the Association.

RSA 2000 cE-11 s10;2011 c3 s7

Capacity and powers

11 The Association has the capacity and, subject to this Act, the rights, powers and privileges of a natural person.

RSA 2000 cE-11 s11;2007 c13 s10

Council

12(1) There is hereby established a governing body of the Association called the Council.

(2) The Council shall manage and conduct the business and affairs of the Association and exercise the powers of the Association in the name of and on behalf of the Association.

(3) The Council shall submit annually to the Minister in a form satisfactory to the Minister a report on those matters of the business and affairs of the Association that the Minister requires.

(4) The Minister shall, on receipt of the annual report of the Association, lay it before the Legislative Assembly if it is then sitting, and if it is not then sitting, within 15 days after the commencement of the next sitting.

1981 cE-11.1 s12

Registrar

13 The Council shall appoint a Registrar for the purposes of this Act.

1981 cE-11.1 s13

Council members

14(1) Subject to subsection (2), the Council shall include the president, 2 vice-presidents, the immediate past-president and at least 12 other professional members, the number of which shall be prescribed by the bylaws, each of whom shall be elected by the professional members at the time, in the manner and for the period provided for in the bylaws.

(2) The Council shall consist of

(a) at least 16 professional members among whom there shall be not less than

013496

(i) 2 professional engineers, and

(ii) 2 professional geoscientists,

and

(b) when the total number of elected professional members does not exceed 20, 3 members of the public, who shall be appointed by the Minister, after consultation with the Association, for a 3-year term of office.

(3) For each 10 elected professional members by which the membership of the Council exceeds 20, an additional member of the public shall be appointed by the Minister, after consultation with the Association, for a 3-year term of office.

(4) A member of the Council appointed under subsection (2)(b) continues to hold office after the expiry of the member's term of office until the member is reappointed or the member's successor is appointed.

(5) The Minister may, after consultation with the Council, revoke the appointment of a member of the Council made under subsection (2)(b).

(6) The Minister may pay to a member of the Council appointed under subsection (2)(b) travelling and living expenses incurred by that member for the member's attendance at any meeting of the Council while away from the member's usual place of residence and fees in an amount prescribed by the Minister.

(7) The powers, duties and operations of the Council under this Act, the regulations and the bylaws are not affected by

(a) the fact that no member of the public is appointed as a member of the Council pursuant to subsection (2)(b),

(b) the revocation under subsection (5) of the appointment of a member of the public, or

(c) the resignation from the Council of a member of the public.

(8) The failure of a member of the public appointed under subsection (2)(b) to attend a meeting of the Council shall not be construed to affect or restrict the Council from exercising at that meeting any powers or performing any duties under this Act, the regulations or the bylaws.

RSA 2000 cE-11 s14;2011 c3 s8

Practice Review Board

15(1) There is hereby established a board called the Practice Review Board consisting of not less than 5 members as follows:

(a) the Council shall appoint not less than 4 professional members who have a combination of knowledge and experience suitable for determining the academic qualifications and experience necessary for a person to continue to engage in the practice of the profession of engineering or geoscience;

(b) the Minister shall appoint one member of the public nominated by the Council.

(2) If the Council fails, within a reasonable period of time after being requested to do so by the Minister, to make a nomination for the purposes of subsection (1)(b), the Minister may appoint a member of the public to the Practice Review Board without the Council's nomination.

(3) The Minister may pay to the member of the Board appointed under subsection (1)(b) travelling and living expenses incurred by that member for the member's attendance at a hearing of the Board while away from the member's usual place of residence and fees in an amount prescribed by the Minister.

(4) The Minister may, after consultation with the Council, revoke the appointment under subsection (1)(b) of a member of the public.

(5) The powers, duties and operations of the Board under this Act, the regulations and the bylaws are not affected by

(a) the fact that no member of the public is appointed as a member of the Board pursuant to subsection (1)(b),

(b) the revocation under subsection (4) of the appointment of a member of the public, or

(c) the resignation as a member of the Board of a member of the public.

(6) The failure of a member of the public appointed under subsection (1)(b) to attend a meeting of the Board shall not be construed to affect or restrict the Board from exercising at that meeting any powers or performing any duties under this Act, the regulations or the bylaws.

RSA 2000 cE-11 s15;2001 c10 s3;2011 c3 s32

Powers of the Practice Review Board

16(1) The Practice Review Board

(a) shall, on its own initiative or at the request of the Council, inquire into

(i) the assessment of existing and the development of new educational standards and experience requirements that are conditions precedent to obtaining and continuing registration under this Act,

(ii) the evaluation of desirable standards of competence of professional members, licensees, permit holders and certificate holders generally,

(iii) the practice of the profession by professional members, licensees, permit holders or certificate holders generally, and

(iv) any other matter that the Council from time to time considers necessary or appropriate in connection with the exercise of its powers and the performance of its duties in relation to competence in the practice of the profession under this Act and the regulations, and

(b) may conduct a review of the practice of a professional member, licensee, permit holder or certificate holder in accordance with this Act and the regulations.

(2) The Board shall report to and advise the Council with respect to any matter dealt with by it pursuant to subsection (1).

(3) A person requested to appear at an inquiry under this section by the Board is entitled to be represented by counsel.

(4) The Board may, after a review under this section with respect to an individual practitioner, make any order that the Discipline Committee may make under section 63 or 64.

(5) The provisions of Part 5 with respect to an investigation by the Investigative Committee apply to a review of an individual practitioner by the Practice Review Board.

(6) The Board may at any time during an inquiry or review under this section recommend to the Investigative Committee that the inquiry or review be conducted by the Investigative Committee pursuant to Part 5.

(7) On receiving a recommendation under subsection (6), the Investigative Committee may proceed with an investigation under Part 5 as if the recommendation were a written complaint.

(8) After each inquiry under this section, the Board shall make a written report to the Council on the inquiry and may make any recommendations to the Council that the Board considers appropriate in connection with the matter inquired into, with reasons for the recommendations.

(9) The Council may, if it considers it to be in the public interest to do so, direct that the whole or any portion of an inquiry by the Board under this section shall be held in camera.

1981 cE-11.1 s16;1995 c14 s6;1998 c14 s5

Appeal to Appeal Board

17 A professional member, licensee, permit holder or certificate holder who is the subject of a hearing or a review by the Practice Review Board may appeal any decision or order of the Board to the Appeal Board as if it were a decision or order of the Discipline Committee under Part 5.

1981 cE-11.1 s17;1995 c14 s7

Appeal Board

18(1) There is hereby established an Appeal Board consisting of

(a) the professional members appointed by the Council in accordance with the regulations, and

(b) one member of the public appointed by the Minister, after consultation with the Association, for a 3-year term of office.

(2) A member of the Appeal Board appointed under subsection (1)(b) continues to hold office after the expiry of the member's term of office until the member is reappointed or the member's successor is appointed.

(3) The Minister may, after consultation with the Appeal Board, revoke the appointment of a member of the Appeal Board made under subsection (1)(b).

(4) The Minister may pay to a member of the Appeal Board appointed under subsection (1)(b) travelling and living expenses incurred by that member for the member's attendance at any meeting of the Appeal Board while away from the member's usual place of residence and fees in an amount prescribed by the Minister.

(5) The powers, duties and operations of the Appeal Board under this Act, the regulations and the bylaws are not affected by

(a) the fact that no member of the public is appointed as a member of the Appeal Board pursuant to subsection (1)(b),

(b) the revocation of the appointment of a member of the public, or

(c) the resignation from the Appeal Board of a member of the public.

(6) The failure of a member of the public appointed pursuant to subsection (1)(b) to attend a meeting of the Appeal Board shall not be construed to affect or restrict the Appeal Board from exercising any powers or performing any duties under this Act, the regulations or the bylaws at that meeting.

1995 c14 s8

Part 3
Regulations and Bylaws

Regulations

19(1) The Council may make regulations

(a) respecting the establishment of categories of and conditions respecting the enrolment of engineers-in-training, geoscientists-in-training, examination candidates and students;

(b) respecting the academic qualifications of and experience requirements for applicants for registration as professional engineers or geoscientists;

(c) governing the evaluation by the Council, the Board of Examiners, the Practice Review Board, the Appeal Board or a committee established by any of them of the academic qualifications of and experience requirements for applicants for registration to engage in the practice of engineering or geoscience and the examination of those applicants with respect to those qualifications or requirements;

(d) respecting the eligibility of applicants generally for registration to engage in the practice of engineering or geoscience;

(e) respecting the powers, duties and functions of the Practice Review Board, including but not limited to the referral of matters by that Board to the Council or the Investigative Committee and appeals from decisions of that Board;

(f) respecting the appointment of members of the Appeal Board, other than the public member;

(g) prescribing the number of members that constitutes a quorum of the Council, the Investigative Committee, the Appeal Board, the Practice Review Board, the Board of Examiners or the Discipline Committee;

(h) governing the establishment of boards or committees of professional members and respecting the delegation of powers of the Council to those boards or committees or the Practice Review Board;

(i) prescribing technical standards for the practice of the profession;

013499

(j) establishing and providing for the publication of a code of ethics respecting the practice of the profession, the maintenance of the dignity and honour of the profession and the protection of the public interest;

(k) governing the names under which professional members, licensees, permit holders and certificate holders may engage in the practice of the profession;

(l) governing, subject to this Act, the operation and proceedings of the Appeal Board, the Board of Examiners and the Practice Review Board, the designation of chair and vice-chair, the appointment of acting members and the procedures for filling vacancies in the offices of chair and vice-chair and in the membership of any of those Boards, and the appointment to any of those Boards of members by virtue of their office and prescribing their powers, duties and functions;

(m) respecting the procedures of the Discipline Committee, of the Practice Review Board, of the Investigative Committee and of the Appeal Board in matters relating to the conduct or practice of professional members, licensees, permit holders or certificate holders, whether or not a complaint has been made;

(n) respecting the establishment by the Council of a compulsory continuing education program for professional members and licensees;

(o) governing the publication of a notice of the suspension or cancellation of the registration of a professional member, licensee, permit holder or certificate holder in a form and manner prescribed by the Council;

(p) respecting committees of inquiry for reinstatement under Part 5;

(q) - (w) repealed 2007 c13 s11;

(x) establishing classes or categories of professional engineers or geoscientists and licensees or permit holders and prescribing the restrictions of practice and the privileges and obligations of the classes or categories so established;

(y) respecting the academic and other qualifications and the experience required of the classes or categories established under clause (x);

(z) respecting the use of stamps, seals and permit numbers;

(aa) governing the eligibility for registration of persons, firms, partnerships and other entities as permit holders or certificate holders;

(bb) governing the operation of permit holders or certificate holders;

(cc) governing the publication of information with respect to the profession, including but not limited to the publication of surveys of fees;

(dd) respecting registration, licensing, the issuing of permits and certificates, disciplinary matters and the practice of engineering and geoscience generally;

(ee) respecting the service on any person of a document or notice required to be served under this Act.

(2) Repealed 2007 c13 s11.

(3) A regulation under subsection (1) may be made only by the Council.

(4) A regulation must be approved in principle by a majority of the professional members

(a) present and voting at a special meeting called for that purpose,

(b) voting by a mail vote or a vote authorized by bylaw that is conducted by electronic, telecommunication or other appropriate means, or

(c) at the annual general meeting following the Council's adoption of the regulation.

(5) The Council may change the text of a regulation that was approved in principle under subsection (4) if the change

(a) is consistent with the approval in principle, and

(b) is made before the regulation is submitted to the Lieutenant Governor in Council for approval.

(6) A regulation made under this section does not come into force unless it has been approved by the Lieutenant Governor in Council.

RSA 2000 cE-11 s19;2007 c13 s11;2011 c3 s9

Bylaws

20(1) The Council may make bylaws

(a) for the government of the Association and the management and conduct of its affairs;

(b) determining the location of the head office of the Association;

(c) respecting the calling of and conduct of meetings of the Association and the Council;

(d) respecting the nomination, election, number and term of office of Council members and officers of the Association and the appointment of individuals as members of the Council by virtue of their office, the Discipline Committee, the Practice Review Board, the Appeal Board, the Board of Examiners and any other committee established by the Council and prescribing their powers, duties and functions;

(e) prescribing those areas of the professions of engineering and geoscience from which members of the Board of Examiners shall be appointed by the Council;

(f) respecting the appointment, functions, duties and powers of a Chief Executive Officer of the Association;

(g) respecting the establishment of districts and branches of the Association and their operation;

(h) providing for the division of Alberta into electoral districts and prescribing the number of Council members to be elected from each district;

(i) providing for the appointment of a Deputy Registrar who has all of the powers and can perform all of the duties of the Registrar under this Act, the regulations and the bylaws when the Registrar is absent, or unable to act or when there is a vacancy in the office of Registrar;

(j) establishing classes or categories of membership in the Association in addition to professional engineers and professional geoscientists and prescribing the rights, privileges and obligations of the classes or categories of membership so established;

(k) providing for the appointment of acting members of the Council and procedures for the election or appointment of professional members to fill vacancies on the Council;

(l) prescribing the number of professional members that constitutes a quorum at meetings of the Association;

(m) governing the establishment, operation and proceedings of committees, the appointment of members of committees, the appointment of acting members and procedures for filling vacancies on committees and the delegation of any powers or duties of the Council under this Act, the regulations or the bylaws to a committee established by the Council or under this Act;

(n) prescribing fees and expenses payable to members of the Association for attending to the business of the Association;

(o) respecting the establishment and payment of sums of money for scholarships, fellowships and any other educational incentive or benefit program that the Council considers appropriate;

(p) governing the information to be engraved on stamps and seals issued to professional members, licensees and restricted practitioners;

(q) respecting permit numbers issued to permit holders;

(r) respecting the fixing of fees, dues and levies payable to the Association;

(s) respecting the costs payable by any person on the conclusion of a hearing or review by the Practice Review Board or under Part 5;

(t) respecting the establishment, content and maintenance of registers of professional members, licensees, permit holders and certificate holders and of records of other classes or categories of membership to be kept by the Registrar;

(u) respecting the removal from the registers and records of any memorandum or entry made in them under this Act or the bylaws;

(v) requiring professional members, licensees, permit holders and certificate holders to inform the Registrar in writing of their current mailing addresses and of any change of address forthwith after the change occurs;

(w) prescribing the form of a certificate of registration, a licence, a permit, a certificate of authorization and an annual certificate;

(x) respecting the expiry of annual certificates, annual licences, permits and other authorizations.

(2) The Council may make bylaws respecting the holding of mail votes or votes conducted by electronic, telecommunication or other appropriate means on any matter relating to the Association, but a bylaw under this subsection does not come into force unless it is approved by a majority of professional members of the Association present and voting at a general meeting.

(3) A bylaw under subsection (1) does not come into force unless it is approved by a majority of the professional members

(a) present and voting at a general meeting, or

(b) voting by a mail vote or vote conducted by electronic, telecommunication or other appropriate means conducted in accordance with the bylaws.

(4) The *Regulations Act* does not apply to bylaws of the Association made under this section.

RSA 2000 cE-11 s20;2007 c13 s12;2011 c3 s10

Consultation with Ministers required

20.1 Before the Council, by regulation, establishes or amends the academic qualifications for applicants for registration as professional engineers, geologists or geophysicists, the Council must consult with the Minister and the Minister responsible for Parts 1 to 3 of the *Post-secondary Learning Act* and must consider the comments received from those Ministers.

2010 c7 s3

Part 4
Registration

Registers and membership records

21(1) The Registrar shall maintain, in accordance with the bylaws and subject to the direction of the Council, a register for each of the following:

(a) professional engineers;

(b) professional geoscientists;

(c) repealed 2011 c3 s11;

(d) licensees to engage in the practice of

(i) professional engineering, or

(ii) professional geoscience;

(iii)repealed 2011 c3 s11;

(e) permit holders to engage in the practice of

(i) professional engineering, or

(ii) professional geoscience;

(iii)repealed 2011 c3 s11;

(f) joint firms;

(g) restricted practitioners.

(2) The Registrar shall enter in the appropriate register the name of a person who has paid the fee prescribed under the bylaws, and

(a) whose registration to engage in the practice of

(i) engineering, as a professional engineer or licensee, or

(ii) geoscience, as a professional geoscientist or licensee,

(iii)repealed 2011 c3 s11,

has been approved by the Board of Examiners,

(b) whose registration to engage in the practice of the profession as a permit holder has been approved by the Council, or

(c) whose registration to engage in the practice of engineering has been approved

(i) in the case of a joint firm, by the Council, or

(ii) in the case of a restricted practitioner, in accordance with section 37.

(3) The Registrar shall maintain, in accordance with the bylaws and subject to the direction of the Council, a membership record of the members in each class or category of membership established under the regulations and the bylaws.

RSA 2000 cE-11 s21;2011 c3 s11

Registration as professional member

22 The Board of Examiners shall approve for registration as a professional engineer or professional geoscientist an individual who has applied to the Board and is eligible in accordance with this Act and the regulations to become a professional engineer or professional geoscientist, as the case may be.

RSA 2000 cE-11 s22;2011 c3 s12

Registration as licensee

23 The Board of Examiners shall approve the registration as a licensee of an individual who has applied to the Board of Examiners and is eligible in accordance with this Act and the regulations to become registered to engage in the practice of engineering or geoscience as a licensee.

RSA 2000 cE-11 s23;2011 c3 s32

Registration of permit holders

24(1) The Council shall approve the registration as a permit holder of a partnership or other association of persons, or of a corporation incorporated or registered under the *Companies Act* or continued, incorporated or registered under the *Business Corporations Act*, that has applied to the Council and is eligible under this section and the regulations to become registered to engage in the practice of engineering or geoscience as a permit holder.

(2) A partnership or other association of persons or a corporation that applies to the Council is eligible to become registered as a permit holder entitled to engage in the practice of engineering or geoscience if it satisfies the Council that it complies with the Act and the regulations.

RSA 2000 cE-11 s24;2011 c3 s32

Evidence of registration

25(1) On entering the name of a professional engineer or geoscientist in the register, the Registrar shall issue to the professional engineer or geoscientist

013503

(a) a certificate of registration, and

(b) a stamp or seal engraved as prescribed in the bylaws.

(2) On entering the name of a licensee in the register, the Registrar shall issue to the licensee

(a) a licence to engage in the practice of engineering or geoscience as a licensee as authorized in the licence, and

(b) a stamp or seal engraved as prescribed in the bylaws.

(3) On entering the name of a permit holder in the register, the Registrar shall issue to the permit holder

(a) a permit to engage in the practice of engineering or geoscience as a permit holder as authorized in the permit, and

(b) a permit number as prescribed in the bylaws.

(4) On entering the name of a joint firm in the register, the Registrar shall issue to the joint firm

(a) a certificate of authorization to engage in the practice of engineering and architecture, and

(b) a permit number as prescribed in the bylaws.

(5) On entering the name of a restricted practitioner in the register, the Registrar shall issue to that individual a certificate of authorization to engage in the restricted scope of the practice of engineering that is specified in the certificate.

(6) A certificate of registration, a licence, a permit or a certificate of authorization issued under this section entitles the holder to engage in the practice of engineering or geoscience, as the case may be, subject to this Act, the regulations and the bylaws.

RSA 2000 cE-11 s25;2011 c3 s13

Annual certificate

26(1) A professional member, licensee, permit holder or certificate holder engaged in the practice of engineering or geoscience shall pay to the Association the annual fee prescribed under the bylaws.

(2) The Registrar shall issue an annual certificate in accordance with the bylaws to a professional member, licensee, permit holder or certificate holder

(a) whose registration is not under suspension, and

(b) who has paid the annual fee.

(3) Subject to this Act, an annual certificate entitles the professional member, licensee, permit holder or certificate holder to engage in the practice of engineering or geoscience, as the case may be, during the year for which the annual certificate is issued.

(4) Repealed 2007 c13 s13.

RSA 2000 cE-11 s26;2007 c13 s13;2011 c3 s32

Entries in registers

27(1) The registration of a professional member, licensee, permit holder or certificate holder is suspended when the decision to suspend the registration is made in accordance with this Act.

(2) The Registrar shall enter a memorandum of suspension of a registration in the appropriate register indicating

(a) the duration of the suspension, and

(b) the reason for the suspension.

(3) The registration of a professional member, licensee, permit holder or certificate holder is cancelled when the decision to cancel the registration is made in accordance with this Act.

(4) The Registrar shall enter a memorandum of cancellation of a registration in the appropriate register.

(5) The Registrar shall not remove from the registers any memorandum made by the Registrar under this section, except in accordance with the bylaws.

1981 cE-11.1 s26

List of registrants open to the public

28 The Registrar shall maintain and, during regular office hours, permit any person to inspect a list of all the professional members, licensees, permit holders and certificate holders in good standing.

1981 cE-11.1 s27

Cancellation on request

29(1) The Registrar shall not cancel the registration of a professional member, licensee, permit holder or certificate holder at that person's request unless the request for the cancellation has been approved by the Council.

(2) When a request for cancellation of a registration is approved by the Council

(a) the Registrar shall cancel that registration, and

(b) the professional member, licensee, permit holder or restricted practitioner requesting the cancellation shall, on being notified of the approval,

(i) immediately surrender to the Registrar

(A) the certificate of registration, licence and the stamp or seal, in the case of a professional member, licensee or restricted practitioner, or

(B) the permit and annual certificate, in the case of a permit holder,

and

(ii) cease using the permit number, in the case of a permit holder.

(3) The Council may direct the Registrar to reinstate in the applicable register a registration that was cancelled under this section, subject to any conditions that the Council may prescribe, and to reissue the certificate of registration, licence or permit and the stamp, seal or permit number.

(4) Notwithstanding subsection (3), if a person whose registration is cancelled applies to be reinstated more than 7 years after the date of the cancellation, the application for reinstatement must be referred to the Board of Examiners.

1981 cE-11.1 s28;1995 c14 s12;1998 c14 s9

Board of Examiners

30(1) The Council shall establish a Board of Examiners in accordance with the regulations.

(2) The Minister shall appoint as members of the Board of Examiners 3 persons from a list of members of the public nominated by the Council.

(3) If the Council fails, within a reasonable period of time after being requested to do so by the Minister, to make nominations for the purposes of subsection (2), the Minister may appoint 3 members of the public to the Board of Examiners without the Council's nomination.

(4) The Minister may pay to a member of the Board appointed under subsection (2) travelling and living expenses incurred by that member for the member's attendance at a hearing of the Board while away from the member's usual place of residence and fees in an amount prescribed by the Minister.

(5) The Minister may, after consultation with the Council, revoke the appointment under subsection (2) of a member of the public.

(6) The powers, duties and operations of the Board under this Act, the regulations and the bylaws are not affected by

(a) the fact that no member of the public is appointed as a member of the Board pursuant to subsection (2),

(b) the revocation under subsection (5) of the appointment of a member of the public, or

(c) the resignation as a member of the Board of a member of the public.

(7) The failure of a member of the public appointed under subsection (2) to attend a meeting of the Board is not to be construed to affect or restrict the Board from exercising at that meeting any powers or performing any duties under this Act, the regulations or the bylaws.

(8) The Board of Examiners shall consider applications for the registration of applicants as professional members or licensees in accordance with this Part, the regulations and the bylaws and may

(a) approve the registration,

(b) refuse the registration, or

(c) defer the approval of registration until it is satisfied that the applicant has complied with a requirement made under this section.

(9) The Board of Examiners may, in its discretion, require an applicant for registration

(a) to pass one or more examinations set by the Board,

(b) to obtain more experience of a kind satisfactory to the Board for a period set by the Board, or

(c) to pass one or more examinations and obtain more experience

before it approves the registration.

1981 cE-11.1 s29;1984 c17 s11;1995 c14 s13

Approval by the Board of Examiners

31(1) The Board of Examiners shall approve the registration as a professional member of a person who proves to the satisfaction of the Board that

(a) the person is of good character and reputation,

(b) the person is a Canadian citizen or lawfully admitted to Canada for permanent residence, and

(c) the person meets the requirements of the regulations.

(2) If an applicant for registration as a licensee is not a Canadian citizen or lawfully admitted to Canada for permanent residence but otherwise complies, to the satisfaction of the Board of Examiners, with subsection (1), the Board shall approve the registration.

1981 cE-11.1 s30;1984 c17 s12;1995 c14 s14

Review by the Appeal Board

32(1) The Board of Examiners shall send a written notice of any decision made by it under this Part to the applicant.

(2) If the decision made by the Board is to refuse or defer registration of the applicant, reasons for the decision shall be sent in writing to the applicant.

(3) If the decision made by the Board is to approve the registration, the Registrar shall publish a notice of approval in accordance with the bylaws.

(4) An applicant whose application for registration has been refused by the Board of Examiners may, within 30 days after receiving a notice of refusal and the reasons for refusal, appeal the decision to the Appeal Board by serving a notice of appeal on the Registrar.

(5) On receiving a notice of appeal, the Registrar shall set a date, time and place for the hearing of the appeal and notify the appellant, in writing, of the date, time and place.

(6) The appellant may appear with counsel and make representations to the Appeal Board.

(7) On concluding the hearing, the Appeal Board may make any decision the Board of Examiners was authorized to make.

1981 cE-11.1 s31;1995 c14 s15

Joint firms

33(1) In this section and sections 34 and 35,

(a) "Architects Association" means The Alberta Association of Architects under the *Architects Act*;

(b) "architects firm" means a partnership or corporation

(i) that

(A) confines its practice to providing architectural consulting services, or

(B) if it does not confine its practice to providing architectural consulting services, engages in a practice satisfactory to the Joint Board,

and

(ii) in which registered architects

(A) hold a majority interest, and

(B) control the partnership or corporation,

and that is otherwise entitled to engage in the practice of architecture under the *Architects Act*;

(c) "engineers firm" means a partnership or corporation

(i) that

(A) confines its practice to providing engineering consulting services, or

(B) if it does not confine its practice to providing engineering consulting services, engages in a practice satisfactory to the Joint Board,

and

(ii) in which professional engineers

(A) hold a majority interest, and

(B) control the partnership or corporation,

and that is otherwise entitled to engage in the practice of engineering under this Act;

(d)"proposed engineers and architects firm" means a partnership or corporation

(i) that

(A) proposes to confine its practice to providing engineering consulting services and architectural consulting services, or

(B) if it does not propose to confine its practice to providing engineering consulting services and architectural consulting services, proposes to engage in a practice satisfactory to the Joint Board,

and

(ii) in which professional engineers and registered architects

(A) hold a majority interest, and

(B) control the partnership or corporation,

and that is otherwise entitled to engage in the practice of engineering under this Act or the practice of architecture under the *Architects Act*.

(2) An application for a certificate of authorization may be made by the following:

(a) a professional engineer;

(b) a registered architect;

(c) an engineers firm;

(d) an architects firm;

(e) a proposed engineers and architects firm;

(f) a partnership or corporation that is not referred to in clause (c), (d) or (e) that the Joint Board considers a suitable applicant for a certificate of authorization.

(3) An applicant under subsection (2) shall

(a) if its prime activity is the provision of engineering consulting services, apply to the Council, and

(b) if its prime activity is the provision of architectural consulting services, apply to the council of the Architects Association.

1981 cE-11.1 s32

Approval by Joint Board

34(1) Every application under section 33 shall be referred to the Joint Board by the council to which it was made, with or without comment from that council.

(2) The Joint Board shall consider with respect to each application referred to it whether

(a) the applicant is eligible to apply under section 33(2);

(b) the applicant has at least one full-time employee who is a professional engineer who shall take responsibility for the engineering work of the applicant and at least one full-time employee who is a registered architect who shall take responsibility for the architectural work of the applicant;

(c) the presence of any ownership interests in the applicant will give rise to conflicts with the professional responsibilities of the firm;

(d) the granting of a certificate of authorization to the applicant will give rise to unauthorized practice or otherwise lead to circumvention of this Act or the *Architects Act*;

(e) any detriment to the public would result from the applicant becoming entitled to engage in the practice of both engineering and architecture.

(3) After considering an application for a certificate of authorization referred to it, the Joint Board shall recommend

(a) in the case of an application by a registered architect or an architects firm, to the Council,

(b) in the case of an application by a professional engineer or an engineers firm, to the council of the Architects Association, or

(c) in the case of an application by a proposed engineers and architects firm or other applicant, to the Council and to the council of the Architects Association,

whether or not to grant a certificate of authorization, based on the criteria considered by it under subsection (2).

1981 cE-11.1 s33

Registration of joint firm

35(1) On receipt of a recommendation of the Joint Board under section 34, the Council may approve the registration of a proposed engineers and architects firm if that firm is eligible to become registered under the regulations.

(2) When recommendations are made by the Joint Board to both the Council and the council of the Architects Association with respect to an application for a certificate of authorization, both councils must agree that the certificate should be issued and both shall sign the certificate before it is issued.

(3) Subject to subsection (2), an applicant is entitled to be registered as a joint firm when the Council approves its registration.

1981 cE-11.1 s34

Duties of joint firm

36(1) A joint firm may engage in the practice of both engineering and architecture in

(a) the names of the individuals who are its partners,

(b) its corporate name, or

(c) any other name that is approved by the Council pursuant to the bylaws.

(2) A joint firm shall advise the Registrar in writing of

(a) the names of the individual shareholders, directors and officers of the firm,

(b) the names of the employees who are professional engineers and registered architects, and

(c) of any change in those shareholders, directors, officers or employees forthwith after the change occurs.

(3) When a joint firm causes plans, drawings, detail drawings and specifications prepared in its practice of engineering, or prepared by other persons and reviewed by the professional members in its practice of engineering, to be signed by its proper officers and affixed with the permit number issued to the firm, it shall also cause them to be signed by and imprinted with the stamp or seal of the professional engineer who

(a) had supervision and control over their preparation, or

(b) reviewed and assumed professional responsibility for them.

1981 cE-11.1 s35;1998 c14 s10

Restricted practitioner

37(1) The Joint Board may recommend to the Council that a certificate of authorization be issued to an individual who is a registered architect who

(a) has historically competently provided a service in the practice of professional engineering in Alberta, and

(b) applied for the certificate before October 1, 1982.

(2) On receipt of a recommendation under subsection (1), the Council may approve the registration of an individual who has applied to the Council and is eligible under the bylaws to become registered as a restricted practitioner.

(3) If the Council approves the registration of an individual as a restricted practitioner, it shall specify in the certificate and in the register the restricted scope of the practice of engineering in which the individual is permitted to engage.

1981 cE-11.1 s36;1983 cD-25.5 s23

Exemption from stamp or seal requirement

38 On the recommendation of the Joint Board, the Council may authorize an individual who is a registered architect under the *Architects Act* to apply for a permit authorized by the regulations under the *Safety Codes Act* without the final design drawings and specifications of the building having the stamp or seal of a professional engineer.

1981 cE-11.1 s37;1991 cS-0.5 s70;1995 c14 s16

Cancellation

39(1) The Council may direct the Registrar to cancel the registration of

013509

(a) a professional member, licensee or permit holder who is in default of payment of annual fees or any other fees, dues or levies payable under this Act, or

(b) a permit holder if it no longer has employees in compliance with this Act,

after the expiration of 30 days following the service on the professional member, licensee or permit holder of a written notice by the Council pursuant to subsection (2), unless the professional member, licensee or permit holder on whom the notice is served complies with the notice.

(2) The notice under subsection (1) shall state that the Registrar may cancel the registration unless

(a) the fees, dues or levies are paid as indicated in that notice, or

(b) evidence satisfactory to the Council has been received by it within the time prescribed in the notice indicating that the permit holder has employees in compliance with this Act.

(3) The Council may direct the Registrar to cancel the registration of a professional member, licensee or permit holder that was entered in error in the register.

(4) If the registration of a professional member or licensee has been cancelled under this section, the professional member or licensee shall forthwith surrender to the Registrar any certificate of registration, licence, stamp or seal issued to the professional member or licensee.

(5) If the registration of a permit holder has been cancelled under this section, the permit holder shall immediately surrender the permit to the Registrar and cease to use the permit number issued to that permit holder.

(6) If a registration has been cancelled pursuant to subsection (1), the Council may direct the Registrar, subject to any conditions that the Council may prescribe, to reinstate that registration in the applicable register and to reissue the certificate of registration, licence or permit and the stamp, seal or permit number.

(7) Notwithstanding subsection (6), if a person whose registration is cancelled applies to be reinstated more than 7 years after the date of the cancellation, the application for reinstatement must be referred to the Board of Examiners.

1981 cE-11.1 s38;1995 c14 s17;1998 c14 s11

Cancellation of a joint firm

40(1) The Council may direct the Registrar to cancel the registration of a joint firm that

(a) is in default of payment of annual fees or any other fees, dues or levies payable under this Act, or

(b) ceases to have at least one professional engineer and at least one registered architect to take the responsibility referred to in section 34(2)(b),

after the expiration of one month following the service on the joint firm of a written notice that the Council intends to cancel the registration, unless the joint firm on which the notice is served complies with the notice.

(2) The notice under subsection (1) shall state that the Registrar may cancel the registration unless

(a) the fees, dues or levies are paid as indicated in the notice, or

(b) the joint firm has at least one professional engineer and at least one registered architect to take the responsibility referred to in section 34(2)(b).

(3) If the registration of a joint firm has been cancelled under this section, the joint firm shall forthwith surrender to the Registrar the certificate of authorization and the stamp issued to it.

(4) The Council may direct the Registrar, subject to any conditions that the Council may prescribe, to reinstate the joint firm in the applicable register and to reissue the certificate of authorization and the stamp.

1981 cE-11.1 s39

Cancellation of restricted practitioners

41(1) The Council may direct the Registrar to cancel the registration of a restricted practitioner who

(a) is in default of payment of annual fees or any other fees, dues or levies payable under this Act, or

(b) who is not a registered architect in good standing under the *Architects Act*,

after the expiration of one month following the service on the restricted practitioner of a written notice that the Council intends to cancel the registration, unless the restricted practitioner on whom the notice is served complies with the notice.

(2) The notice under subsection (1) shall state that the Registrar may cancel the registration unless

(a) the fees, dues or levies are paid as indicated in the notice, or

(b) the restricted practitioner is a registered architect in good standing under the *Architects Act*.

(3) If the registration of a restricted practitioner has been cancelled under this section, the restricted practitioner shall forthwith surrender to the Registrar the certificate of authorization and the stamp issued to it.

(4) The Council may direct the Registrar, subject to any conditions that the Council may prescribe, to reinstate the restricted practitioner in the applicable register and to reissue the certificate of authorization and the stamp.

1981 cE-11.1 s40

Part 5
Discipline

Definitions

42 In this Part,

(a) "conduct" includes an act or omission;

(b) "investigated person" means a professional member, licensee, permit holder, certificate holder or member-in-training with respect to whose conduct an investigation is held under this Part;

(c) "practice of the profession" means practice of engineering or practice of geoscience, as the case may be.

RSA 2000 cE-11 s42;2011 c3 s14

Complaints

43(1) A person may complain to the Registrar, or to a person who is authorized in writing by the Registrar to receive complaints, about the conduct of a professional member, licensee, permit holder, certificate holder or member-in-training, and the complaint shall be dealt with in accordance with this Part and the regulations.

(2) A complaint must be in writing.

(3) A complaint respecting the conduct of a professional member, licensee, permit holder or certificate holder whose registration was cancelled pursuant to this Act may, notwithstanding the cancellation, be dealt with within 2 years following the date of cancellation of the registration as if the cancellation had not occurred.

(4) Notwithstanding section 47, a person designated by the Registrar as a mediator may assist in settling a complaint if the complainant and the person about whose conduct the complaint was made agree, but if within 30 days from the date of receipt of the complaint, or a longer period agreed to by those persons, a settlement of the complaint between those persons does not occur, or in the mediator's opinion is not likely to occur, the complaint shall be referred forthwith by the Registrar to the Investigative Committee.

(5) If a complaint is settled with the assistance of a mediator, any agreement that is reached by the complainant and the person about whose conduct the complaint was made must be reviewed by the Investigative Committee, and that Committee may

(a) approve the agreement, or

(b) proceed with a preliminary investigation in accordance with section 47.

1981 cE-11.1 s42;1984 c17 s13;1995 c14 s18

013511

Determination of unprofessional conduct and unskilled practice

44(1) Any conduct of a professional member, licensee, permit holder, certificate holder or member-in-training that in the opinion of the Discipline Committee or the Appeal Board

(a) is detrimental to the best interests of the public,

(b) contravenes a code of ethics of the profession as established under the regulations,

(c) harms or tends to harm the standing of the profession generally,

(d) displays a lack of knowledge of or lack of skill or judgment in the practice of the profession, or

(e) displays a lack of knowledge of or lack of skill or judgment in the carrying out of any duty or obligation undertaken in the practice of the profession,

whether or not that conduct is disgraceful or dishonourable, constitutes either unskilled practice of the profession or unprofessional conduct, whichever the Discipline Committee or the Appeal Board finds.

(2) If an investigated person fails to comply with or contravenes this Act, the regulations or the bylaws, and the failure or contravention is, in the opinion of the Discipline Committee, of a serious nature, the failure or contravention may be found by the Discipline Committee to be unprofessional conduct whether or not it would be so found under subsection (1).

1981 cE-11.1 s43;1995 c14 s19

Discipline Committee

45(1) The Council shall establish a Discipline Committee, the members of which shall be appointed in accordance with the regulations.

(2) The Council shall make regulations governing, subject to this Part, the operation and proceedings of the Discipline Committee, the designation of a chair, the appointment of acting members and the procedures for filling vacancies in the offices of the chair and the membership and the appointment of members by virtue of their office, and prescribing their powers, duties and functions.

(3) The Council may make regulations respecting the hearing of a matter under this Part by a panel of the Discipline Committee.

(4) A regulation made under subsection (2) or (3) does not come into force unless it has been approved by the Lieutenant Governor in Council.

1981 cE-11.1 s44;1984 c17 s14

Investigative Committee

46(1) The Council shall establish an Investigative Committee, the members of which shall be appointed in accordance with the regulations.

(2) The Council shall make regulations governing, subject to this Part, the operation and proceedings of the Investigative Committee, the designation of a chair, the appointment of members, acting members and members by virtue of their office and the procedures for filling vacancies in the offices of the chair and the membership, and prescribing their powers, duties and functions.

(3) A regulation made under subsection (2) does not come into force unless it has been approved by the Lieutenant Governor in Council.

1995 c14 s20

Investigation panel

47 When a complaint is referred to the Investigative Committee under section 43, the Investigative Committee shall appoint an investigation panel from among its members to conduct a preliminary investigation.

1981 cE-11.1 s45;1995 c14 s21

Notice of preliminary investigation

48 The Registrar shall forthwith send notice in writing to the investigated person that a preliminary investigation is being conducted.

1981 cE-11.1 s46

Evidence for preliminary investigation

49(1) An investigation panel may

(a) require the investigated person or any other member of the Association to produce any plans, drawings, detailed drawings, specifications, reports, books, papers or other documents or records in that person's possession or control, and

(b) copy and keep copies for the purposes of this Part of any thing that is produced under clause (a).

(2) An investigation panel may investigate any other matter regarding the conduct of the investigated person that arises in the course of the investigation.

1981 cE-11.1 s47;1995 c14 s22

Report to Investigative Committee

50 On concluding a preliminary investigation, the investigation panel shall report its findings to the Investigative Committee.

1981 cE-11.1 s48;1995 c14 s23

Termination of investigation

51(1) The Investigative Committee may terminate an investigation at any time if it is of the opinion that

(a) the complaint is frivolous or vexatious, or

(b) there is insufficient evidence of unskilled practice of the profession or unprofessional conduct.

(2) On terminating an investigation, the Investigative Committee shall direct the Registrar to serve on the investigated person and on the complainant, if any, a notice in accordance with the bylaws that the investigation has been terminated.

(3) A complainant who is served with a notice under subsection (2) informing the complainant that the investigation has been terminated may, by notice in writing to the Registrar within 30 days after receipt of the notice under subsection (2), appeal that decision to the Appeal Board.

(4) On an appeal under subsection (3), the Appeal Board shall

(a) uphold the decision of the Investigative Committee to terminate the investigation if, in the opinion of the Appeal Board,

(i) the complaint is frivolous or vexatious, or

(ii) there is insufficient evidence of unskilled practice of the profession or unprofessional conduct,

or

(b) refer the matter to the Discipline Committee for a formal hearing.

(5) The Appeal Board shall notify the complainant, the investigated person and the Investigative Committee in writing of its decision under subsection (4).

1981 cE-11.1 s49;1984 c17 s15;1995 c14 s24;1998 c14 s12

Power of Investigative Committee to recommend an order

52(1) If an investigation is not terminated under section 51, the Investigative Committee may

013513

(a) if the investigated person has admitted to conduct that constitutes unskilled practice of the profession or to unprofessional conduct, recommend, in accordance with subsection (2), any order that the Investigative Committee considers appropriate, or

(b) refer the matter to the Discipline Committee for a formal hearing.

(2) An order recommended by the Investigative Committee must be provided to a member of the Discipline Committee who has been designated by that Committee to act as a case manager.

(3) If the case manager agrees with the order recommended by the Investigative Committee, the case manager must discuss the order with the investigated person and, if the investigated person agrees with the order, the order has the same force and effect as an order made by the Discipline Committee following a formal hearing.

(4) If the case manager or the investigated person rejects the order recommended by the Investigative Committee, the matter must be referred to the Discipline Committee for a formal hearing.

1995 c14 s25

Duty of Discipline Committee

53(1) On the referral of a matter to the Discipline Committee for a formal hearing, the Discipline Committee shall hold the hearing forthwith.

(2) Notwithstanding subsection (1), if proceedings in respect of the same circumstances or events are commenced in Provincial Court or the Court of Queen's Bench, the Discipline Committee may adjourn the hearing.

(3) The Registrar shall serve on the investigated person and on the complainant, if any, a notice of hearing stating the date, time and place at which the Discipline Committee will hold the hearing and giving reasonable particulars of the conduct or complaint in respect of which the hearing will be held.

1981 cE-11.1 s50;1984 c17 s16;1995 c14 s26

Further investigation

54(1) The Discipline Committee may also investigate and hear any other matter concerning the conduct of the investigated person that arises in the course of the hearing, but in that event the Committee shall declare its intention to investigate and hear the further matter and shall permit the person sufficient opportunity to prepare the person's answer to the further matter.

(2) Sections 56 to 62 apply to an investigation and hearing of a further matter under subsection (1).

1981 cE-11.1 s51

Suspension pending investigation and hearing

55(1) Notwithstanding anything in this Act, the Investigative Committee may suspend the registration of a professional member, licensee, permit holder, certificate holder or member-in-training pending a preliminary investigation or a decision of the Discipline Committee.

(2) A person whose registration is suspended under subsection (1) may apply to the Court for an order staying the suspension.

(3) A copy of an application under subsection (2) must be served on the Registrar.

RSA 2000 cE-11 s55;2009 c53 s59

Right to counsel and to appearance

56 The Investigative Committee and the investigated person may appear and be represented by counsel at a hearing before the Discipline Committee.

1981 cE-11.1 s53;1984 c17 s18;1995 c14 s28

Public hearings

57 All hearings before the Discipline Committee and the Appeal Board under this Part are open to the public unless that Committee or Board orders otherwise.

1981 cE-11.1 s54;1995 c14 s29

Evidence

58(1) Evidence may be given before the Discipline Committee in any manner that the Committee considers appropriate, and the Committee is not bound by the rules of law respecting evidence applicable to judicial proceedings.

(2) For the purposes of an investigation, hearing or review under this Act, any member of the Appeal Board, the Discipline Committee or the Practice Review Board is conferred with the power of a commissioner for oaths under the *Commissioners for Oaths Act*.

1981 cE-11.1 s55;1995 c14 s30

Witnesses and documents

59(1) The investigated person and any other person who in the opinion of the Discipline Committee has knowledge of the complaint or any conduct being investigated are compellable witnesses in any proceeding under this Part.

(2) A witness may be examined on oath on all matters relevant to the investigation or hearing and is not to be excused from answering any question on the ground that the answer might

(a) tend to incriminate the witness,

(b) subject the witness to punishment under this Part, or

(c) tend to establish the witness's liability

(i) to a civil proceeding at the instance of the Crown or of any other person, or

(ii) to prosecution under any Act or regulations under any Act,

but if the answer so given tends to incriminate the witness, subjects the witness to punishment or tends to establish the witness's liability, it shall not be used or received against the witness in any civil proceedings, in a prosecution under Part 7 or in any proceeding under any other Act, except in a prosecution for or proceedings in respect of perjury or the giving of contradictory evidence.

(3) For the purpose of obtaining the testimony of a witness who is out of Alberta, a judge of the Court on an application ex parte by the Association may direct the obtaining of the evidence of the witness in the manner provided under the *Alberta Rules of Court* for the taking of the evidence of a person outside Alberta.

RSA 2000 cE-11 s59;2009 c53 s59

Enforcement of attendance and production of documents

60(1) The attendance of witnesses before the Discipline Committee and the production of plans, drawings, detail drawings, specifications, reports, books, papers and other documents or records may be enforced by a notice issued by the Registrar requiring the witness to attend and stating the date, time and place at which the witness is to attend and the plans, drawings, detail drawings, specifications, reports, books, papers and other documents or records, if any, the witness is required to produce.

(2) On the written request of the investigated person or of the investigated person's counsel or agent, the Registrar shall without charge issue and deliver to that person or that person's counsel or agent any notices that that person or that person's counsel or agent may require for the attendance of witnesses or the production of documents or records.

(3) A witness other than the investigated person who has been served with a notice to attend or a notice for the production of documents or records under subsection (1) or (2) is entitled to be paid the same fees, expenses and allowances as are payable to witnesses in an action in the Court.

RSA 2000 cE-11 s60;2009 c53 s59

Failure to give evidence

61(1) Proceedings for civil contempt of court may be brought against a witness

(a) who fails

(i) to attend before the Discipline Committee in compliance with a notice to attend,

(ii) to produce any books, papers or other documents or records in compliance with a notice to produce them, or

013515

(iii)in any way to comply with either notice,

or

(b) who refuses to be sworn or to answer any question directed to be answered by the Discipline Committee.

(2) If the witness referred to in subsection (1) is the investigated person, the witness's failure or refusal may be held to be unprofessional conduct.

(3) The Discipline Committee, on proof of service of the notice of investigation on the investigated person and the complainant, if any, may

(a) proceed with the investigation in the absence of either or both of those persons, and

(b) act on the matter being investigated in the same way as though either or both of those persons were in attendance.

1981 cE-11.1 s58

Finding by the Discipline Committee

62(1) The Discipline Committee may find that the conduct of an investigated person constitutes neither unskilled practice of the profession nor unprofessional conduct.

(2) The Discipline Committee may find that the conduct of an investigated person constitutes unskilled practice of the profession or unprofessional conduct, or both, and shall deal with the investigated person in accordance with this Part.

1981 cE-11.1 s59

Powers of the Discipline Committee

63 If the Discipline Committee finds that the conduct of the investigated person is unprofessional conduct or unskilled practice of the profession, or both, the Discipline Committee may make any one or more of the following orders:

(a) reprimand the investigated person;

(b) suspend the registration of the investigated person for a specified period;

(c) suspend the registration of the investigated person either generally or from any field of practice until

(i) the investigated person has completed a specified course of studies or obtained supervised practical experience, or

(ii) the Discipline Committee is satisfied as to the competence of the investigated person generally or in a specified field of practice;

(d) accept in place of a suspension the investigated person's undertaking to limit the investigated person's practice;

(e) impose conditions on the investigated person's entitlement to engage in the practice of the profession generally or in any field of the practice, including the conditions that the investigated person

(i) practise under supervision,

(ii) not engage in sole practice,

(iii)permit periodic inspections by a person authorized by the Discipline Committee, or

(iv)report to the Discipline Committee on specific matters;

(f) direct the investigated person to pass a particular course of study or satisfy the Discipline Committee as to the investigated person's practical competence generally or in a field of practice;

(g) direct the investigated person to satisfy the Discipline Committee that a disability or addiction can be or has been overcome, and suspend the person until the Discipline Committee is so satisfied;

(h) require the investigated person to take counselling or to obtain any assistance that in the opinion of the Discipline Committee is appropriate;

(i) direct the investigated person to waive, reduce or repay a fee for services rendered by the investigated person that, in the opinion of the Discipline Committee, were not rendered or were improperly rendered;

(j) cancel the registration of the investigated person;

(k) any other order that it considers appropriate in the circumstances.

1981 cE-11.1 s60

Order to pay costs or a fine

64(1) The Discipline Committee may, in addition to or instead of dealing with the investigated person in accordance with section 63, order that the investigated person pay

(a) all or part of the costs of the hearing in accordance with the bylaws,

(b) a fine not exceeding $10 000 to the Association, or

(c) both the costs under clause (a) and a fine under clause (b),

within the time fixed by the order.

(2) If the investigated person ordered to pay a fine, costs, or both, under subsection (1) fails to pay the fine, costs, or both, within the time ordered, the Discipline Committee may suspend the registration of that person until the person has paid the fine, costs or both.

(3) A fine or costs ordered to be paid to the Association under this section is a debt due to the Association and may be recovered by the Association by civil action for debt.

1981 cE-11.1 s61;1984 c17 s19

Service of written decision

65(1) The Discipline Committee shall, within a reasonable time after the conclusion of a hearing, make a written decision on the matter, in which it shall

(a) describe each finding made in accordance with this Part,

(b) state the reasons for each finding made, and

(c) state any order made under this Part.

(2) The Discipline Committee shall immediately forward to the Registrar

(a) the decision, and

(b) the record of the hearing, consisting of all evidence presented before it, including

(i) all exhibits,

(ii) all documents and records, and

(iii) a transcript of all testimony given before it, whether recorded electronically, mechanically or in handwritten form.

(3) The Registrar shall, immediately on receiving the decision and the record of the hearing referred to in subsection (2), serve

(a) a copy of the decision on the investigated person and the Investigative Committee, and

(b) a notice of the nature of the decision on the complainant, if any.

(4) The investigated person or the investigated person's counsel or agent may examine the record or any part of the record of the proceedings and hear any recording or examine any mechanical or handwritten form of record of any testimony.

1981 cE-11.1 s62;1995 c14 s31

Suspension or cancellation pending appeal

66(1) Notwithstanding an appeal under this Part, the Discipline Committee may order that its decision remain in effect until the Appeal Board or the Court of Appeal, as the case may be, makes its decision on the appeal.

(2) An investigated person may apply to the Court for an order staying the decision of the Discipline Committee pending the determination of the appeal.

(2.1) A copy of an application under subsection (2) must be served on the Registrar.

(3) The Court may hear an application made under this section not less than 10 days after the application has been served on the Registrar.

(4) On hearing an application made under this section the Court may, subject to any conditions that it considers proper, stay the decision of the Discipline Committee pending the determination of the appeal.

RSA 2000 cE-11 s66;2009 c53 s59

Appeal to Appeal Board

67(1) The Investigative Committee or the investigated person may appeal to the Appeal Board any finding or order of the Discipline Committee.

(2) An appeal under subsection (1) shall be commenced by a written notice of appeal that shall

(a) describe the finding or order appealed from,

(b) state the reasons for the appeal, and

(c) be served on the Registrar not more than 30 days after the date that the decision of the Discipline Committee was served on the investigated person.

(3) On receiving a notice of appeal from the Investigative Committee, the Registrar shall forthwith provide a copy to the investigated person and make the record of the hearing available to the investigated person.

(4) On receiving a notice of appeal, the Registrar shall provide a copy to the Appeal Board and make the record of the hearing available to each member of the Appeal Board.

1981 cE-11.1 s64;1984 c17 s21;1995 c14 s33

Time of appeal

68(1) The Appeal Board, on receiving a notice of appeal under section 67, shall serve on the investigated person and the Investigative Committee a notice of hearing of an appeal stating the date, time and place that the Appeal Board will hear the matters appealed.

(2) The Appeal Board shall hear an appeal forthwith.

1981 cE-11.1 s65;1995 c14 s34

Powers of the Appeal Board on appeal

69(1) The Appeal Board on an appeal may do any or all of the following:

(a) grant adjournments of the proceedings or reserve the determination of the matters before it for a future meeting of the Appeal Board;

(b) receive further evidence on granting special leave for that purpose;

(c) draw inferences of fact and make a determination or finding that in its opinion ought to have been made by the Discipline Committee;

(d) order that the matter be referred back to the Discipline Committee.

(2) Sections 56 to 62, 65 and 66 apply to the hearing of an appeal by the Appeal Board.

(3) The Appeal Board shall forthwith after the date of the conclusion of all proceedings before it,

(a) make any finding as to the conduct of the investigated person that in its opinion ought to have been made by the Discipline Committee,

(b) quash, confirm or vary the finding or order of the Discipline Committee or substitute or make a finding or order of its own, or

(c) refer the matter back to the Discipline Committee for further consideration in accordance with any direction that the Appeal Board may make.

(4) The Appeal Board may order the investigated person to pay all or part of the costs of the appeal determined in accordance with the bylaws.

1981 cE-11.1 s66;1984 c17 s22;1995 c14 s35

Appeal to the Court of Appeal

70(1) An investigated person may appeal to the Court of Appeal any finding or order made by the Appeal Board under section 69.

(2) The Appeal Board shall be the respondent in an appeal under subsection (1) and may make representations to the Court of Appeal.

(3) An appeal under this section shall be commenced

(a) by filing a notice of appeal with the Registrar of the Court of Appeal in Edmonton or Calgary, and

(b) by serving a copy of the notice of appeal on the Registrar,

both within 30 days from the date on which the decision of the Appeal Board is served on the investigated person.

1981 cE-11.1 s68;1984 c17 s24;1995 c14 s36

Order for stay pending appeal

71 The appellant may, after commencing an appeal and on notice to the Registrar, apply to the Court of Appeal for an order staying all or any part of the order or decision of the Appeal Board appealed.

1981 cE-11.1 s69;1984 c17 s25;1995 c14 s37

Material in support of appeal

72(1) An appeal under section 70 shall be supported by copies, certified by the Registrar, of the decision of the Appeal Board and the record of the appeal before the Appeal Board.

(2) The Registrar, on being paid any disbursements and expenses in connection with a request made by the appellant or the appellant's solicitor or agent, shall furnish to the appellant or the appellant's solicitor or agent the number of copies so requested of the documents mentioned in subsection (1).

1981 cE-11.1 s70;1984 c17 s26;1995 c14 s37

Power of the court on appeal

73(1) The Court of Appeal on hearing the appeal may do any or all of the following:

(a) make any finding that in its opinion ought to have been made;

(b) quash, confirm or vary the order or decision of the Appeal Board or any part of it;

(c) refer the matter back to the Appeal Board for further consideration in accordance with any direction of the Court of Appeal;

(d) direct that a new trial of any mixed questions of law and fact relating to a finding or order, or to both a finding and an order of the Appeal Board made under section 69, be held before the Court.

(2) The Court of Appeal may make any award as to the costs of an appeal to it that it considers appropriate.

1981 cE-11.1 s71;1984 c17 s27;1995 c14 s37

013519

Fraudulent registration

74(1) If the Council is satisfied, after a hearing on the matter, that a person whose registration is entered in the register obtained registration by means of any false or fraudulent representation or declaration, either oral or written, the Council shall order that the person's registration be cancelled.

(2) The provisions of this Part respecting the procedures of the Discipline Committee apply to a hearing held by the Council under subsection (1).

1981 cE-11.1 s72

Surrender of certificates

75(1) If the registration of a professional member, licensee or restricted practitioner has been cancelled or suspended under this Part, the professional member, licensee or restricted practitioner shall immediately surrender any certificate, stamp or seal to the Registrar.

(2) If the registration of a permit holder or joint firm has been cancelled or suspended under this Part, the permit holder or joint firm shall immediately

(a) surrender the permit or certificate of authorization to the Registrar, and

(b) cease using the permit number issued by the Registrar.

(3) If the registration of a professional member, licensee, permit holder or certificate holder has been cancelled under this Part, the registration shall not be reinstated in the register except by order of the Council, the Court or the Court of Appeal.

(4) No order shall be made under subsection (3) within one year after

(a) the date on which the registration was cancelled, or

(b) if an order was granted staying the imposition of a punishment imposed by the Council and the punishment is later confirmed by the Court or the Court of Appeal, the date on which the Court or the Court of Appeal made its order confirming the punishment.

(5) A member of the Council who is a member of a committee of inquiry appointed pursuant to the regulations to consider an application under this Part for reinstatement of registration may participate in or vote at any proceedings of the Council under this section, and the Registrar and the Association's solicitor may participate in those proceedings.

1981 cE-11.1 s73;1998 c14 s13

Misrepresentation of status

76 The conduct of a person who is or was registered as a professional member, licensee, permit holder or certificate holder who represents or holds out that the person is registered and in good standing while the person's registration is suspended or cancelled may be dealt with as being unprofessional conduct in accordance with this Part.

1981 cE-11.1 s74

Publication

77 After a finding or order is made by the Discipline Committee, the Council, the Appeal Board, the Court or the Court of Appeal under this Part, the name of the investigated person may be published in accordance with the regulations.

1981 cE-11.1 s75;1995 c14 s38

Part 6
General

Use of stamps, seal, permit number

78(1) A professional member, licensee or restricted practitioner shall, in accordance with the regulations,

(a) sign documents or records, and

(b) stamp or seal documents or records.

013520

(2) A permit holder shall affix its permit number on documents or records in accordance with the regulations.

1981 cE-11.1 s76;1984 c17 s28;1998 c14 s14

Exemption from municipal licence

79 No municipality has the power to require

(a) any professional member, licensee, permit holder or certificate holder to obtain a licence from the municipality to engage in the practice of engineering or the practice of geoscience, or

(b) any member-in-training to obtain a licence from the municipality for or in connection with the performance of any acts or services authorized by this Act to be performed by a member-in-training.

RSA 2000 cE-11 s79;2011 c3 s15

Liability to others

80(1) The relationship between a permit holder or certificate holder engaged in the practice of engineering or geoscience and a person receiving the professional services of the permit holder or certificate holder is subject to this Act, the regulations and any other law applicable to the relationship between a professional member and the professional member's client.

(2) The relationship of a professional member or licensee to a permit holder, whether as member, shareholder or employee of the permit holder, does not affect, modify or diminish the application of this Act, the regulations and the bylaws

(a) to the professional member or licensee personally as a professional member or licensee, or

(b) to the relationship between the professional member or licensee and the professional member's or licensee's client.

RSA 2000 cE-11 s80;2011 c3 s32

Registrar's certificate

81(1) A certificate purporting to be signed by the Registrar and stating that a named person was or was not, on a specified day or during a specified period,

(a) a professional member, licensee or certificate holder, or

(b) an officer of the Association or a member of the Council

shall be admitted in evidence as proof, in the absence of evidence to the contrary, of the facts stated in it without proof of the Registrar's appointment or signature.

(2) A certificate purporting to be signed by the Registrar and stating that a named corporation, partnership or other association of persons was or was not, on a specified day or during a specified period, a permit holder or certificate holder shall be admitted in evidence as proof, in the absence of evidence to the contrary, of the facts stated in it without proof of the Registrar's appointment or signature.

1981 cE-11.1 s78

Protection from liability

82(1) No action lies against

(a) any person conducting a preliminary investigation, a member of the Discipline Committee, the Practice Review Board, the Investigative Committee, the Appeal Board, the Council or the Board of Examiners, the Registrar, the Association or any person acting on the instructions of any of them, or

(b) any member, officer or employee of the Association

for anything done by that person or body in good faith and in purporting to act under this Act, the regulations or the bylaws.

013521

(2) No action for defamation may be founded on a communication that consists of or pertains to a complaint regarding the conduct of a professional member, licensee, permit holder, certificate holder or member-in-training, if the communication is published to or by

(a) the Association,

(b) a member of the Council, the Discipline Committee, the Practice Review Board, the Investigative Committee, the Appeal Board or the Board of Examiners,

(c) a person conducting a preliminary investigation,

(d) an officer or employee of the Association, or

(e) a person acting on the instructions of any of them

in good faith in the course of investigating the complaint or in the course of any proceedings under Part 5 relating to the complaint.

1981 cE-11.1 s79;1995 c14 s39

Part 7
Professional Licensees

Scope of practice

83 No professional licensee shall engage in the practice of engineering or geoscience except within the scope of practice specified by the Board of Examiners.

2007 c13 s14;2011 c3 s32

Exclusive use of name

83.01(1) No individual, corporation, partnership or other entity, except a professional licensee (engineering) or a permit holder entitled to engage in the practice of engineering, shall use the title "professional licensee (engineering)".

(2) No individual, corporation, partnership or other entity, except a professional licensee (geoscience) or a permit holder entitled to engage in the practice of geoscience, shall use the title "professional licensee (geoscience)".

2011 c3 s16

Prohibition on holding out

83.1 No individual, corporation, partnership or other entity, except a professional licensee, shall represent or hold out, expressly or by implication, that the person is a professional licensee.

2007 c13 s14

Stamp or seal of professional licensee (engineering)

83.2(1) No individual, corporation, partnership or other entity, except a professional licensee (engineering), shall affix the stamp or seal of a professional licensee (engineering) or allow that stamp or seal to be affixed to a plan, drawing, detail drawing, specification or other document or a reproduction of any of them unless

(a) that plan, drawing, detail drawing, specification, other document or reproduction was prepared by or under the supervision and control of, and

(b) the stamp or seal is affixed with the knowledge and consent or in accordance with the direction of

the professional licensee (engineering) to whom the stamp or seal was issued.

(2) Notwithstanding subsection (1), a professional licensee (engineering) may affix a stamp or seal to a plan, drawing, detail drawing, specification, other document or reproduction prepared by other persons if the professional licensee (engineering) completes a thorough review of and accepts professional responsibility for that plan, drawing, detail drawing, specification, other document or reproduction.

2007 c13 s14

013522

Stamp or seal of professional licensee (geoscience)

83.3(1) No individual, corporation, partnership or other entity, except a professional licensee (geoscience), shall affix the stamp or seal of a professional licensee (geoscience), or allow that stamp or seal to be affixed, to a map, geoscientific cross-section, specification, report or other document or a reproduction of any of them unless

(a) that map, geoscientific cross-section, specification, report, other document or reproduction was prepared by or under the supervision and control of, and

(b) the stamp or seal is affixed with the knowledge and consent or in accordance with the direction of

the professional licensee (geoscience), to whom the stamp or seal was issued.

(2) Notwithstanding subsection (1), a professional licensee (geoscience) may affix a stamp or seal to a map, geoscientific cross-section, specification, report or other document or reproduction prepared by other persons if the professional licensee (geoscience), completes a thorough review of and accepts professional responsibility for that map, geoscientific cross-section, specification, report, other document or reproduction.

2007 c13 s14;2011 c3 s17

Non-application of provisions to professional licensees

83.4(1) Sections 2(1) and 3(1)(b)(i) do not apply to a professional licensee (engineering) engaged in the practice of engineering within the scope of practice specified by the Board of Examiners.

(2) Sections 5(1) and 6(1)(b)(i) do not apply to a professional licensee (geoscience) engaged in the practice of geoscience within the scope of practice specified by the Board of Examiners.

(3) Repealed 2011 c3 s18.

2007 c13 s14;2011 c3 s18

Register for professional licensees

83.5(1) The Registrar shall maintain, in accordance with the bylaws and subject to the direction of the Council, a register for each category of professional licensee.

(2) The Registrar shall enter in the appropriate register the name of a person who has paid the fee prescribed under the bylaws and whose registration to engage in the practice of engineering or geoscience as a professional licensee has been approved by the Board of Examiners.

2007 c13 s14;2011 c3 s32

Eligibility for registration

83.6 A person who meets the requirements of this Act and the regulations and applies to the Registrar for registration is entitled to become registered as a professional licensee.

2007 c13 s14

Application for registration

83.7(1) The Board of Examiners shall consider applications for the registration of applicants as professional licensees in accordance with this Act, the regulations and the bylaws, and may

(a) approve the registration,

(b) refuse the registration, or

(c) defer the approval of registration until it is satisfied that the applicant has complied with a requirement made under this section.

(2) The Board of Examiners may, at its discretion, require an applicant for registration

(a) to pass one or more examinations set by the Board,

(b) to obtain more experience of a kind satisfactory to the Board for a period set by the Board, or

013523

(c) to pass one or more examinations and obtain more experience

before it approves the registration.

(3) If the Board of Examiners approves the registration of an individual as a professional licensee, it shall specify in the certificate and in the register the scope of practice of engineering or geoscience in which the individual is permitted to engage.

2007 c13 s14;2011 c3 s32

Registration as professional licensee

83.8 The Board of Examiners shall approve for registration as a professional licensee an individual who has applied to the Board and is eligible in accordance with this Act and the regulations to engage in the practice of engineering or geoscience within the scope of practice specified by the Board of Examiners.

2007 c13 s14;2011 c3 s32

Evidence of registration

84 On entering the name of a professional licensee in the register, the Registrar shall issue to that individual

(a) a certificate of registration to engage in the practice of engineering or geoscience, as the case may be, within the scope of practice specified by the Board of Examiners, and

(b) a stamp or seal engraved as prescribed in the bylaws.

2007 c13 s14;2011 c3 s32

Regulation-making authority

85 The Council may make regulations or bylaws applicable to professional licensees in respect of any of the matters under sections 19 and 20.

2007 c13 s14

Fees

86 Fees prescribed under the bylaws in respect of professional licensees must not be greater than the corresponding fees fixed in respect of professional members.

2007 c13 s14

Annual licence

86.1(1) A professional licensee engaged in the practice of engineering or geoscience shall pay to the Association the annual fee prescribed in the bylaws.

(2) The Registrar shall issue an annual licence in accordance with the bylaws to a professional licensee

(a) whose registration is not under suspension, and

(b) who has paid the annual fee.

(3) Subject to this Act, an annual licence entitles the professional licensee to engage in the practice of engineering or geoscience within the scope of practice specified by the Board of Examiners during the year for which the annual licence is issued.

2007 c13 s14;2011 c3 s32

Application of Act

86.2(1) Sections 14, 15, 16, 17, 19(4), 20(3), 24, 27, 28, 29, 31, 39, 78, 79, 80(2), 81 and 82(2) apply to a professional licensee as if the professional licensee were a professional member.

(2) Section 2(4)(a) applies to a professional licensee (engineering) practising within the scope of practice specified by the Board of Examiners as if that professional licensee (engineering) were a professional engineer or licensee.

013524

(3) Section 5(2)(a) applies to a professional licensee (geoscience) practising within the scope of practice specified by the Board of Examiners as if that professional licensee (geoscience) were a professional geoscientist or licensee.

(4) Repealed 2011 c3 s19.

(5) Section 32 applies to a professional licensee as if the professional licensee were an applicant.

(6) Part 5 applies to a professional licensee as if the professional licensee were a professional member.

2007 c13 s14;2011 c3 s19

Practice prohibitions

86.3(1) A person whose registration as a professional licensee is cancelled or suspended under this Act shall not, without the consent of the Council, engage in the practice of engineering or geoscience or directly or indirectly associate with any professional member, professional licensee, licensee, permit holder or certificate holder in the practice of engineering, geology or geophysics.

(2) No professional licensee shall, in the practice of engineering or geoscience, except with the permission of the Council, directly or indirectly associate with or employ in connection with the professional licensee's practice a person whose registration has been cancelled or suspended under this Act.

2007 c13 s14;2011 c3 s32

Injunction

86.31 The Court, on application by the Council, may grant an injunction enjoining any person from doing any act or thing that contravenes section 83.01 or 83.1, notwithstanding any penalty that may be provided by this Act or the regulations in respect of that act or thing.

2011 c3 s20

Part 8
ASET, Joint Boards and Committees, Professional Technologists and Other ASET Members

Definitions

86.4 In this Part,

(a) "ASET" means the Association of Science and Engineering Technology Professionals of Alberta continued under section 86.5;

(b) "ASET bylaws" means bylaws enacted under section 87.4;

(c) "ASET member" has the meaning given to it in ASET bylaws;

(d) "ASET permit holder" means a partnership, other association of persons or corporation registered under section 90.4 and to which a permit is issued in accordance with ASET bylaws;

(e) "ASET Registrar" means the individual appointed as ASET Registrar under section 87.1;

(f) "ASET regulations" means regulations enacted under section 87.3;

(g) "Joint Appeal Board" means the Joint Appeal Board established by section 87.5;

(h) "Joint Board of Examiners" means the Joint Board of Examiners established by section 87.5;

(i) "Joint Discipline Committee" means the Joint Discipline Committee established by section 87.5;

(j) "Joint Investigative Committee" means the Joint Investigative Committee established by section 87.5;

(k) "Joint Practice Review Board" means the Joint Practice Review Board established by section 87.5;

(l) "JPT Regulations Committee" means the Joint Professional Technologists Regulations Committee established by section 87.5;

013525

(m) "professional technologist" means an individual who is issued a certificate of registration by the ASET Registrar in accordance with this Act to engage in the practice of engineering or geoscience within the scope of practice specified by the Joint Board of Examiners;

(n) "professional technologist regulations" means regulations enacted under section 88.5 or 88.6;

(o) "regulated member" has the meaning given to it in ASET regulations.

2007 c13 s14;2011 c3 s32

Division 1
ASET

Corporation continued

86.5(1) The Association of Science and Engineering Technology Professionals of Alberta, previously established as a society under the *Societies Act*, is continued as a corporation with that name under this Act.

(2) The abbreviated form of the name of the Association of Science and Engineering Technology Professionals of Alberta is ASET or A.S.E.T.

(3) No person other than the Association of Science and Engineering Technology Professionals of Alberta shall use the abbreviated form of the name of ASET or any other abbreviation alone or in combination with any other word or name in a way that represents expressly or by implication that the person is a member of or connected in any way with ASET.

2007 c13 s14

Capacity and powers

86.6 ASET has the capacity and, subject to this Act, the rights, powers and privileges of a natural person.

2007 c13 s14

ASET Council

87(1) The governing body of ASET continues to be its Council.

(2) ASET Council shall manage and conduct the business and affairs of ASET and exercise the powers of ASET in the name of and on behalf of ASET.

(3) ASET Council shall submit annually to the Minister, in a form satisfactory to the Minister, a report on those matters of the business and affairs of ASET that the Minister requires.

(4) The Minister shall, on receipt of the annual report of ASET, lay it before the Legislative Assembly if it is then sitting, and if it is not then sitting, within 15 days after the commencement of the next sitting.

2007 c13 s14

ASET Registrar

87.1 ASET Council shall appoint a Registrar for the purposes of this Part, ASET regulations and ASET bylaws.

2007 c13 s14

ASET Council members

87.2(1) Subject to subsection (2), ASET Council shall include

(a) a president,

(b) 2 vice-presidents and the past president, and

(c) other members, the number of which shall be prescribed by ASET bylaws,

each of whom shall be elected by ASET members at the time, in the manner and for the period provided for in the bylaws.

(2) ASET Council

(a) shall include, when the total number of elected members does not exceed 20, 3 members of the public appointed by the Minister, after consultation with ASET Council, for a 3-year term of office, and

(b) may also include non-voting members of ASET Council determined by ASET bylaws.

(3) For each 10 elected members by which the membership of ASET Council exceeds 20, an additional member of the public shall be appointed by the Minister, after consultation with ASET Council, for a 3-year term of office.

(4) A member of ASET Council appointed under subsection (2)(a) continues to hold office after the expiry of the member's term of office until the member is reappointed or the member's successor is appointed.

(5) The Minister may, after consultation with ASET Council, revoke the appointment of a member of ASET Council made under subsection (2)(a).

(6) The Minister may pay to a member of ASET Council appointed under subsection (2)(a) travelling and living expenses incurred by that member for the member's attendance at any meeting of ASET Council while away from the member's usual place of residence and fees in an amount prescribed by the Minister.

(7) The powers, duties and operations of ASET Council under this Act, ASET regulations and ASET bylaws are not affected by

(a) the fact that no member of the public is appointed as a member of ASET Council pursuant to subsection (2)(a),

(b) the revocation under subsection (5) of the appointment of a member of the public, or

(c) the resignation from ASET Council of a member of the public.

(8) The failure of a member of the public appointed under subsection (2)(a) to attend a meeting of ASET Council shall not be construed to affect or restrict ASET Council from exercising any powers or performing any duties under this Act, ASET regulations or ASET bylaws at that meeting.

2007 c13 s14

ASET regulations

87.3(1) ASET Council may make regulations

(a) respecting the establishment of categories of, and conditions respecting the enrolment of, regulated members, regulated members in training, examination candidates and students;

(b) respecting the academic qualifications of and experience requirements for applicants for registration as regulated members;

(c) governing the evaluation by ASET Council, the ASET Board of Examiners, the ASET Practice Review Board or the ASET Appeal Board, or a committee established by any of them, of the academic qualifications of and experience requirements for applicants for registration to engage in practice as regulated members and the examination of those applicants with respect to those qualifications or requirements;

(d) respecting generally the eligibility of applicants for registration to engage in practice as regulated members;

(e) respecting the powers, duties and functions of the ASET Practice Review Board, including but not limited to the referral of matters by that Board to ASET Council or the ASET Investigative Committee and appeals from decisions of that Board;

(f) respecting the appointment of members of the ASET Appeal Board;

(g) prescribing the number of members that constitutes a quorum of ASET Council, the ASET Investigative Committee, the ASET Appeal Board, the ASET Practice Review Board, the ASET Board of Examiners or the ASET Discipline Committee;

(h) governing the establishment of boards or committees and respecting the delegation of powers of ASET Council to those boards or committees or to the ASET Practice Review Board;

013527

(i) prescribing technical standards of practice for regulated members;

(j) establishing and providing for the publication of a code of ethics respecting the practice of regulated members and the protection of the public interest;

(k) governing the names under which regulated members may engage in practice;

(l) governing, subject to this Act, the operation and proceedings of the ASET Appeal Board, the ASET Board of Examiners and the ASET Practice Review Board, the designation of chair and vice-chair, the appointment of acting members and the procedures for filling vacancies in the offices of chair and vice-chair and in the membership of any of those boards, and the appointment to any of those boards of members by virtue of their office, and prescribing their powers, duties and functions;

(m) respecting the procedures of the ASET Discipline Committee, of the ASET Practice Review Board, of the ASET Investigative Committee and of the ASET Appeal Board in matters relating to the conduct or practice of regulated members, whether or not a complaint has been made;

(n) respecting the establishment by ASET Council of a compulsory continuing education program for regulated members;

(o) governing the publication of a notice of the suspension or cancellation of the registration of a regulated member in a form and manner prescribed by ASET Council;

(p) respecting committees of inquiry for reinstatement;

(q) respecting the titles that may be used by regulated members and the circumstances and conditions under which the titles may be used;

(r) establishing classes or categories of regulated members and prescribing the restrictions of practice and the privileges and obligations of the classes or categories so established;

(s) respecting the academic and other qualifications and the experience required of the classes or categories established in addition to regulated members;

(t) governing the eligibility of persons, firms, partnerships and other entities for registration as ASET permit holders or certificate holders under this Part;

(u) governing the operation of ASET permit holders or certificate holders under this Part;

(v) governing the publication of information with respect to ASET and ASET members;

(w) respecting registration, licensing, the issuing of permits and certificates, disciplinary matters and the practice of regulated members generally;

(x) respecting the service on any person of a document or notice required to be served under this Act;

(y) defining "regulated member" for the purposes of all or any provision of this Act, ASET regulations and ASET bylaws.

(2) A regulation under subsection (1) may be made only by ASET Council.

(3) A regulation must be approved in principle by a majority of the ASET members

(a) present and voting at a special meeting called for that purpose,

(b) voting by a mail vote or a vote authorized by bylaw that is conducted by electronic, telecommunication or other appropriate means, or

(c) at the annual general meeting following ASET Council's adoption of the regulation.

(4) ASET Council may change the text of a regulation that has been approved in principle under subsection (3) if the change

(a) is consistent with the approval in principle, and

(b) is made before the regulation is submitted to the Lieutenant Governor in Council for approval.

(5) A regulation under this section does not come into force unless it has been approved by the Lieutenant Governor in Council.

2007 c13 s14

ASET bylaws

87.4(1) ASET Council may make bylaws

(a) for the government of ASET and the management and conduct of its affairs;

(b) determining the location of the head office of ASET;

(c) respecting the calling of and conduct of meetings of ASET members and ASET Council;

(d) respecting the nomination, election, number and term of office of ASET Council members and officers of ASET and the appointment of individuals as members of ASET Council by virtue of their office, the ASET Discipline Committee, the ASET Practice Review Board, the ASET Appeal Board, the ASET Board of Examiners and any other committee established by ASET Council and prescribing their powers, duties and functions;

(e) prescribing those areas of practice from which members of the ASET Board of Examiners shall be appointed by ASET Council;

(f) respecting the appointment, functions, duties and powers of an Executive Director of ASET;

(g) respecting the establishment of districts and branches of ASET and their operation;

(h) providing for the division of Alberta into electoral districts and prescribing the number of ASET Council members to be elected from each district;

(i) providing for the appointment of a Deputy Registrar of ASET who has all of the powers and may perform all of the duties of the ASET Registrar under this Act, ASET regulations and ASET bylaws when the ASET Registrar is absent or unable to act or when there is a vacancy in the office of the ASET Registrar;

(j) establishing classes or categories of membership in ASET in addition to regulated members and professional technologists and prescribing the rights, privileges and obligations of the classes or categories of membership so established;

(k) providing for the appointment of acting members of ASET Council and procedures for an election or appointment to fill vacancies on ASET Council;

(l) prescribing the quorum at meetings of ASET members;

(m) governing the establishment, operation and proceedings of committees, the appointment of members of committees, the appointment of acting members and procedures for filling vacancies on committees and the delegation of any powers or duties of ASET Council under this Act, ASET regulations or ASET bylaws to a committee established by ASET Council or under this Act;

(n) prescribing fees and expenses payable to members of ASET for attending to the business of ASET;

(o) respecting the establishment and payment of sums of money for scholarships, fellowships and any other educational incentive or benefit program that ASET Council considers appropriate;

(p) respecting the issuing of permit numbers to ASET permit holders;

(q) respecting the fixing of fees, dues and levies payable to ASET;

(r) respecting the costs payable by any person on the conclusion of a hearing or review;

(s) respecting the establishment, contents and maintenance of registers of members and of records of other classes or categories of membership to be kept by the ASET Registrar;

(t) respecting the removal from the registers and records of any memorandum or entry made in them;

013529

(u) requiring members to inform the ASET Registrar in writing of their current mailing addresses and of any change of address forthwith after the change occurs;

(v) prescribing the form of a certificate of registration, a permit, a certificate of authorization and an annual certificate;

(w) defining "ASET members" for the purposes of this Act and ASET regulations and ASET bylaws;

(x) respecting the expiry of annual certificates, annual licences, permits and other authorizations.

(2) ASET Council may make bylaws respecting the holding of mail votes and votes conducted by electronic, telecommunication or other appropriate means on any matter relating to ASET, but a bylaw under this subsection does not come into force unless it is approved by a majority of ASET members present and voting at a general meeting.

(3) A bylaw under subsection (1) does not come into force unless it is approved by a majority of ASET members

(a) present and voting at a general meeting, or

(b) voting by a mail vote or vote conducted by electronic, telecommunication or other appropriate means conducted in accordance with ASET bylaws.

(4) The *Regulations Act* does not apply to ASET bylaws made under this section.

2007 c13 s14

Consultation with Ministers required

87.41 Before the ASET Council, by regulation, establishes or amends the academic qualifications for applicants for registration as regulated members, the Council must consult with the Minister and the Minister responsible for Parts 1 to 3 of the *Post-secondary Learning Act* and must consider the comments received from those Ministers.

2010 c7 s3

Division 2
Joint Boards and Committees

Establishment of joint boards and committees

87.5(1) The following joint boards and committees are established:

(a) Joint Practice Review Board;

(b) Joint Appeal Board;

(c) Joint Professional Technologists Regulations Committee;

(d) Joint Discipline Committee;

(e) Joint Board of Examiners;

(f) Joint Investigative Committee.

(2) Each joint board and committee is, subject to this Act, to be composed of

(a) an equal number of appointees of the Council and ASET Council, and

(b) one member of the public appointed by the Minister, from one or more nominees of the Joint Councils Committee, for a term determined by the Minister.

(3) Every member of a joint board or committee must act solely in the interest of the public and for the safety of the public.

2007 c13 s14

013530

Public appointees to joint boards and committees

87.6(1) The Minister may pay to a member of the public appointed to a joint board or committee by the Minister travelling and living expenses incurred by that member for the member's attendance at a meeting or hearing of the joint board or committee while away from the member's usual place of residence and fees in an amount prescribed by the Minister.

(2) The Minister may, after consultation with the Joint Councils Committee, revoke the appointment of a member of the public appointed to a joint board or committee.

(3) The powers, duties and operations of a joint board or committee under this Act, the regulations and the bylaws are not affected by

(a) the fact that no member of the public is appointed as a member of the joint board or committee,

(b) the revocation of the appointment of a member of the public, or

(c) the resignation as a member of the joint board or committee of a member of the public.

(4) The failure of a member of the public appointed under this section to attend a meeting of a joint board or committee shall not be construed to affect or restrict the joint board or committee from exercising any powers or performing any duties under this Act or the professional technologist regulations at that meeting.

2007 c13 s14

Governance of joint boards and committees

88(1) After consultation with the Council and ASET Council, the Minister shall, by order, prescribe, subject to any provision to the contrary in this Act, with respect to each joint board and committee established under section 87.5,

(a) the number of members, and

(b) the governance and operation of the committee or board, including

(i) the method of appointment and term of the chair,

(ii) the quorum, and

(iii) procedural matters or delegating to the board or committee the authority to make decisions about procedural matters.

(2) Section 20(7) and (8) of the *Interpretation Act* apply to the joint boards and committees.

(3) The *Regulations Act* does not apply to an order made under this section, but the order must be published in Part I of The Alberta Gazette.

2007 c13 s14

Powers of the Joint Practice Review Board

88.1(1) The Joint Practice Review Board

(a) shall, on its own initiative or at the request of either the Council or ASET Council, inquire into

(i) the assessment of existing and the development of new educational standards and experience requirements that are to be conditions precedent to obtaining and continuing registration under this Act as a professional technologist,

(ii) the evaluation of desirable standards of competence of professional technologists generally,

(iii) the practice of professional technologists generally, and

(iv) any other matter that the Council or ASET Council from time to time considers necessary or appropriate in connection with the exercise of its powers and the performance of its duties in relation to competence in the practice of professional technologists under this Act and the professional technologist regulations,

013531

and

(b) may conduct a review of the practice of a professional technologist in accordance with this Act and the professional technologist regulations.

(2) The Joint Practice Review Board shall report to and advise the Council and ASET Council with respect to any matter dealt with by it pursuant to subsection (1).

(3) A person requested to appear at an inquiry under this section by the Joint Practice Review Board is entitled to be represented by counsel.

(4) The Joint Practice Review Board may, after a review under this section with respect to a professional technologist, make any order that the Joint Discipline Committee may make under section 63 or 64.

(5) The provisions of Part 5 with respect to an investigation by the Joint Investigative Committee apply to a review of an individual professional technologist by the Joint Practice Review Board.

(6) The Joint Practice Review Board may at any time during an inquiry or review under this section recommend to the Joint Investigative Committee that the inquiry or review be conducted by the Joint Investigative Committee pursuant to Part 5.

(7) On receiving a recommendation under subsection (6), the Joint Investigative Committee may proceed with an investigation under Part 5 as if the recommendation were a written complaint.

(8) After each inquiry under this section, the Joint Practice Review Board shall make a written report to the Council and ASET Council on the inquiry and may make any recommendations to the Council or ASET Council, or both, that the Joint Board considers appropriate in connection with the matter inquired into, with reasons for the recommendations.

(9) The Joint Practice Review Board, if it considers it to be in the public interest to do so, may direct that the whole or any portion of an inquiry by the Joint Practice Review Board under this section shall be held in camera.

2007 c13 s14

Joint Practice Review Board appointees

88.2 The individuals appointed to the Joint Practice Review Board by the Council and ASET Council must each have a combination of knowledge and experience suitable for determining the academic qualifications and experience necessary for a person to continue to engage in practice as a professional technologist.

2007 c13 s14

Appeal to Joint Appeal Board

88.3 A professional technologist who is the subject of a hearing or a review by the Joint Practice Review Board may appeal any decision or order of the Joint Practice Review Board to the Joint Appeal Board as if it were a decision or order of the Joint Discipline Committee under Part 5.

2007 c13 s14

Joint Appeal Board

88.4 The Joint Appeal Board has all the powers, duties and functions with respect to a professional technologist that the Appeal Board has with respect to professional members.

2007 c13 s14

JPT Regulations Committee authority

88.5(1) The JPT Regulations Committee may make regulations

(a) respecting the eligibility of applicants for registration as professional technologists;

(b) respecting the academic and other qualifications and the experience required of an applicant for registration as a professional technologist, and the evaluation of applicants, and their qualifications and experience, by the Joint Board of Examiners;

(c) respecting the examination of applicants for registration as professional technologists;

(d) respecting the establishment and administration of a register of professional technologists and the functions, duties and responsibilities of the ASET Registrar, including the removal of entries from the register;

(e) respecting the stamps or seals issued to professional technologists, the use of stamps and seals, and the circumstances under which a stamp or seal is to be surrendered to the ASET Registrar;

(f) governing the names under which professional technologists may engage in practice;

(g) establishing a continuing education program for professional technologists;

(h) establishing and providing for the publication of a code of ethics for professional technologists respecting the practice of the profession, the maintenance of the dignity and honour of the profession and the protection of the public interest;

(i) respecting notices of suspension or cancellation, and reinstatement committees;

(j) respecting technical standards of practice for professional technologists;

(k) respecting eligibility of professional technologists for registration as ASET permit holders;

(l) respecting registration, and the issue and use of permits, permit numbers and certificates for professional technologists and respecting the discipline, practice review and the practice of professional technologists generally;

(m) respecting service of documents;

(n) requiring professional technologists to notify the ASET Registrar of name and address changes, and requiring them to keep contact information up to date;

(o) prescribing forms for use under this Act and regulations made under this section, or delegating that function;

(p) respecting the expiry of annual certificates, permits and other authorizations issued to professional technologists.

(2) A regulation under subsection (1) does not come into force unless

(a) the regulation is approved by the Council and by ASET Council, and

(b) the regulation is approved by the Lieutenant Governor in Council.

2007 c13 s14

Consultation with Ministers required

88.51 Before the JPT Regulations Committee, by regulation, establishes or amends the academic qualifications for applicants for registration as professional technologists, the Council must consult with the Minister and the Minister responsible for Parts 1 to 3 of the *Post-secondary Learning Act* and must consider the comments received from those Ministers.

2010 c7 s3

Resolving disputes

88.6(1) If after 2 meetings at which a matter has been discussed the JPT Regulations Committee has not resolved the matter, the Committee may refer the matter to the Joint Councils Committee in accordance with rules established by agreement of the Council and ASET Council.

(2) On receipt of a reference, the Joint Councils Committee may do either or both of the following:

(a) refer the matter, or any aspect of it, back to the JPT Regulations Committee with suggestions or directions about how to resolve it;

(b) resolve the matter, or any aspect of it.

(3) If the Joint Councils Committee fully resolves the matter, the JPT Regulations Committee shall, if required, implement the resolution of the Joint Councils Committee.

013533

(4) If the Joint Councils Committee does not fully resolve the matter and does not refer the matter back to the JPT Regulations Committee under subsection (2), the Joint Councils Committee may, or if 120 days has passed from the date of receipt of the reference from the JPT Regulations Committee, the Joint Councils Committee shall, refer the matter, or any aspect of it that remains unresolved, to arbitration under the *Arbitration Act*.

(5) The Joint Councils Committee may extend the 120-day period if it considers an extension warranted.

(6) The *Arbitration Act* applies to an arbitration under this section with the following change, that the arbitration shall be heard and decided by an arbitration tribunal composed of 3 persons, appointed as follows:

(a) one person shall be appointed by the Council;

(b) one person shall be appointed by ASET Council;

(c) one person shall be appointed as chair of the arbitration tribunal by the Minister.

(7) In addition to the authority of the arbitration tribunal under the *Arbitration Act*, the arbitration tribunal may, as the circumstances require, do either or both of the following:

(a) make a decision binding on the Council, ASET Council and the JPT Regulations Committee;

(b) make a new regulation or amend a regulation respecting professional technologists, and for that purpose the arbitration tribunal has the same authority to make or amend regulations as the JPT Regulations Committee has under section 88.5.

(8) A regulation or amendment made by the arbitration tribunal under subsection (7) does not come into force unless it is approved by the Lieutenant Governor in Council.

2007 c13 s14

Joint Board of Examiners

89 The Joint Board of Examiners has all the powers, duties and functions with respect to professional technologists that the Board of Examiners has with respect to professional members.

2007 c13 s14

Joint Discipline Committee

89.1 The Joint Discipline Committee has all the powers, duties and functions with respect to professional technologists that the Discipline Committee has with respect to professional members.

2007 c13 s14

Joint Investigative Committee

89.2 The Joint Investigative Committee has all the powers, duties and functions with respect to professional technologists that the Investigative Committee has with respect to professional members.

2007 c13 s14

Division 3
Professional Technologists

Scope of practice

89.3 No professional technologist shall engage in the practice of engineering or geoscience except within the scope of practice specified by the Joint Board of Examiners.

2007 c13 s14;2011 c3 s32

Use of title

89.4(1) No individual, corporation, partnership or other entity, except a professional technologist, shall use

(a) the title “professional technologist”, the abbreviation “P. Tech” or any other abbreviation of that title,

(b) the title “professional technologist (engineering)”, the abbreviation “P. Tech (eng)” or any other abbreviation of that title, or

(c) the title "professional technologist (geoscience)", the abbreviation "P. Tech (geo)" or any other abbreviation of that title.

(d) repealed 2011 c3 s21.

(2) No individual, corporation, partnership or other entity, except a professional technologist, shall represent or hold out, expressly or by implication, that the person is a professional technologist.

2007 c13 s14;2011 c3 s22

Stamp or seal

89.5(1) No individual, corporation, partnership or other entity, except a professional technologist (engineering), shall affix the stamp or seal of a professional technologist (engineering) or allow that stamp or seal to be affixed to a plan, drawing, detail drawing, specification or other document or a reproduction of any of them unless

(a) that plan, drawing, detail drawing, specification, other document or reproduction was prepared by or under the supervision and control of, and

(b) the stamp or seal is affixed with the knowledge and consent or in accordance with the direction of

the professional technologist (engineering) to whom the stamp or seal was issued.

(2) Notwithstanding subsection (1), a professional technologist (engineering) may affix a stamp or seal to a plan, drawing, detail drawing, specification, other document or reproduction prepared by other persons if the professional technologist (engineering) completes a thorough review of and accepts professional responsibility for that plan, drawing, detail drawing, specification, other document or reproduction.

(3) No individual, corporation, partnership or other entity, except a professional technologist (geoscience) entitled to engage in the practice of geoscience, shall affix the stamp or seal of a professional technologist (geoscience) or allow that stamp or seal to be affixed to a map, geoscientific cross-section, specification, report or other document or a reproduction of any of them unless

(a) that map, geoscientific cross-section, specification, report, other document or reproduction was prepared by or under the supervision and control of, and

(b) the stamp or seal is affixed with the knowledge and consent or in accordance with the direction of

the professional technologist (geoscience) to whom the stamp or seal was issued.

(4) Notwithstanding subsection (3), a professional technologist (geoscience) may affix a stamp or seal to a map, geoscientific cross-section, specification, report, other document or reproduction prepared by other persons if the professional technologist (geoscience) completes a thorough review of and accepts professional responsibility for that map, geoscientific cross-section, specification, report, other document or reproduction.

2007 c13 s14;2011 c3 s22

Non-application of provisions to professional technologists

89.6 Sections 2(1), 3(1)(b)(i), 5(1) and 6(1)(b)(i) do not apply to a professional technologist engaged in the practice of engineering or geoscience within the scope of practice specified by the Joint Board of Examiners.

2007 c13 s14;2011 c3 s23

Register for professional technologists

90(1) The ASET Registrar shall maintain, in accordance with the professional technologist regulations, a register for professional technologists.

(2) The ASET Registrar shall enter in the register the name of a person who has paid the fee prescribed by ASET bylaws and whose registration to engage in the practice of engineering or geoscience as a professional technologist has been approved by the Joint Board of Examiners.

2007 c13 s14;2011 c3 s32

013535

Registration as professional technologist and scope of practice

90.1(1) The Joint Board of Examiners shall approve for registration as a professional technologist an individual who is eligible in accordance with this Act and the professional technologist regulations to engage in the practice of engineering or geoscience within the scope of practice specified by the Joint Board of Examiners.

(2) When the Joint Board of Examiners specifies the scope of practice for a professional technologist, it must specify a scope of practice that is the routine application of industry recognized codes, standards, procedures and practices using established engineering or applied science principles and methods of problem solving.

(3) For the purposes of subsection (2), the Joint Board of Examiners may

(a) define or describe "routine application";

(b) define or describe "industry recognized";

(c) specify or describe the codes, standards, procedures and practices applicable;

(d) define or describe all or any of the following terms: "engineering or applied science principles" and "methods of problem solving".

2007 c13 s14;2011 c3 s32

Evidence of registration

90.2 On entering the name of a professional technologist in the register, the ASET Registrar shall issue to that individual

(a) a certificate of registration to engage in the practice of engineering or geoscience, as the case requires, within the scope of practice specified by the Joint Board of Examiners, and

(b) a stamp or seal engraved as prescribed in the professional technologist regulations.

2007 c13 s14;2011 c3 s32

Joint Board of Examiners to consider applications

90.3(1) The Joint Board of Examiners shall consider applications for the registration of applicants as professional technologists in accordance with this Act and the professional technologist regulations and may

(a) approve the registration,

(b) refuse the registration, or

(c) defer the approval of registration until it is satisfied that the applicant has complied with a requirement made under this section.

(2) The Joint Board of Examiners may, in its discretion, require an applicant for registration

(a) to pass one or more examinations set by the Joint Board of Examiners,

(b) to obtain more experience of a kind satisfactory to the Joint Board of Examiners for a period set by the Joint Board of Examiners, or

(c) to pass one or more examinations and obtain more experience

before it approves the registration.

2007 c13 s14

Registration of ASET permit holders

90.4(1) ASET Council shall approve the registration as an ASET permit holder of a partnership or other association of persons, or of a corporation incorporated or registered under the *Companies Act* or continued, incorporated or registered under the *Business Corporations Act*, that has applied to ASET Council and is eligible under this section and the professional technologist regulations to become registered to engage in the practice of engineering or geoscience as an ASET permit holder within the scope of practice of those professional technologists who are responsible for the practice of the ASET permit holder.

013536

(2) A partnership or other association of persons or a corporation that applies to ASET Council is eligible to become registered as an ASET permit holder under subsection (1) if it satisfies ASET Council that it complies with this Act and the professional technologist regulations.

2007 c13 s14;2011 c3 s32

Annual certificate

90.5(1) A professional technologist or ASET permit holder engaged in the practice of engineering or geoscience shall pay to ASET the annual fee prescribed under ASET bylaws.

(2) The ASET Registrar shall issue an annual certificate in accordance with ASET bylaws to a professional technologist

(a) whose registration is not under suspension, and

(b) who has paid the annual fee.

(3) Subject to this Act, an annual certificate entitles the professional technologist or ASET permit holder to engage in the practice of engineering or geoscience, as the case may be, during the year for which the annual certificate is issued within the scope of practice of the professional technologist or ASET permit holder.

2007 c13 s14;2011 c3 s32

Entries in registers

90.6(1) The registration of a professional technologist or ASET permit holder is suspended when the decision to suspend the registration is made in accordance with this Act.

(2) The ASET Registrar shall enter a memorandum of suspension of a registration in the appropriate register indicating

(a) the duration of the suspension, and

(b) the reason for the suspension.

(3) The registration of a professional technologist or ASET permit holder is cancelled when the decision to cancel the registration is made in accordance with this Act.

(4) The ASET Registrar shall enter a memorandum of cancellation of a registration in the appropriate register.

(5) The ASET Registrar shall not remove from the register any memorandum made by the ASET Registrar under this section except in accordance with the professional technologist regulations.

(6) The ASET Registrar shall provide the Registrar with access to the registers established for professional technologists.

2007 c13 s14

List of registrants open to the public

91 The ASET Registrar shall maintain and, during regular office hours, permit any person to inspect a list of all the professional technologists and ASET permit holders in good standing.

2007 c13 s14

Cancellation on request

91.1(1) The ASET Registrar shall not cancel the registration of a professional technologist or ASET permit holder at that person's request unless the request for cancellation has been approved by ASET Council.

(2) When a request for cancellation of a registration is approved by ASET Council,

(a) the ASET Registrar shall cancel that registration, and

(b) the professional technologist or ASET permit holder requesting the cancellation shall, on being notified of the approval,

(i) immediately surrender to the ASET Registrar

013537

(A) the certificate of registration, annual certificate and stamp or seal, in the case of a professional technologist, or

(B) the permit and annual certificate, in the case of an ASET permit holder,

and

(ii) cease using the permit number, in the case of an ASET permit holder.

(3) ASET Council may direct the ASET Registrar to reinstate in the applicable register a registration that was cancelled under this section, subject to any conditions that ASET Council may prescribe, and to reissue the certificate of registration, annual certificate or permit and the stamp, seal or permit number.

(4) Notwithstanding subsection (3), if a person whose registration is cancelled applies to be reinstated more than 7 years after the date of the cancellation, the application for reinstatement must be referred to the Joint Board of Examiners.

2007 c13 s14

Review by the Joint Appeal Board

91.2(1) The Joint Board of Examiners shall send a written notice of any decision made by it under this Part to the applicant.

(2) If the decision made by the Joint Board of Examiners is to refuse or defer registration of the applicant, reasons for the decision shall be sent in writing to the applicant.

(3) If the decision made by the Joint Board of Examiners is to approve the registration, the ASET Registrar shall publish a notice of approval in accordance with ASET bylaws.

(4) An applicant whose application for registration has been refused by the Joint Board of Examiners may, within 30 days after receiving a notice of refusal and the reasons for refusal, appeal the decision to the Joint Appeal Board by serving a notice of appeal on the ASET Registrar.

(5) On receiving a notice of appeal, the ASET Registrar shall set a date, time and place for the hearing of the appeal and notify the appellant, in writing, of the date, time and place.

(6) The appellant may appear with counsel and make representations to the Joint Appeal Board.

(7) On concluding the hearing, the Joint Appeal Board may make any decision the Joint Board of Examiners was authorized to make.

2007 c13 s14

Cancellation

91.3(1) ASET Council may direct the ASET Registrar to cancel the registration of

(a) a professional technologist or ASET permit holder who is in default of payment of annual fees or any other fees, dues or levies payable under this Act, or

(b) an ASET permit holder if it no longer has employees in compliance with the professional technologist regulations,

after the expiration of 30 days following the service on the professional technologist or ASET permit holder of a written notice by ASET Council pursuant to subsection (2), unless the professional technologist or ASET permit holder on whom the notice is served complies with the notice.

(2) The notice under subsection (1) shall state that the ASET Registrar may cancel the registration unless

(a) the fees, dues or levies are paid as indicated in that notice, or

(b) evidence satisfactory to ASET Council has been received by it within the time prescribed in the notice indicating that the ASET permit holder has employees in compliance with the professional technologist regulations.

(3) ASET Council may direct the ASET Registrar to cancel the registration of a professional technologist or ASET permit holder that was entered in error in the register.

(4) If the registration of a professional technologist has been cancelled under this section, the professional technologist shall forthwith surrender to the ASET Registrar any certificate of registration, annual certificate and stamp or seal issued to the professional technologist.

(5) If the registration of an ASET permit holder has been cancelled under this section, the ASET permit holder shall immediately surrender the permit to the ASET Registrar and cease to use the permit number issued to that ASET permit holder.

(6) If a registration has been cancelled pursuant to subsection (1), ASET Council may direct the ASET Registrar, subject to any conditions that ASET Council may prescribe, to reinstate that registration in the applicable register and to reissue the certificate of registration, annual certificate or permit and the stamp, seal or permit number.

(7) Notwithstanding subsection (6), if a person whose registration is cancelled applies to be reinstated more than 7 years after the date of the cancellation, the application for reinstatement must be referred to the Joint Board of Examiners.

2007 c13 s14

Application of disciplinary provisions

91.4(1) Part 5, except sections 45 and 46, applies to professional technologists, subject to the following changes:

(a) "professional member" means a professional technologist;

(b) "practice of the profession" means the practice of a professional technologist;

(c) "Registrar" means the ASET Registrar;

(d) "the regulations" means the professional technologist regulations and ASET regulations;

(e) "Investigative Committee" means the Joint Investigative Committee;

(f) "Discipline Committee" means the Joint Discipline Committee;

(g) "Appeal Board" means the Joint Appeal Board;

(h) "bylaws" means the professional technologist regulations and ASET bylaws;

(i) "Council" means the JPT Regulations Committee;

(j) "investigation panel" means an investigation panel established by the Joint Investigative Committee under section 47;

(k) "Association" means ASET;

(l) "Practice Review Board" means the Joint Practice Review Board.

(2) If the registration of a professional technologist has been cancelled under Part 5, the registration shall not be reinstated unless the Joint Board of Examiners approves.

2007 c13 s14

Use of stamps, seals and permit numbers

91.5(1) A professional technologist shall, in accordance with the professional technologist regulations,

(a) sign documents or records, and

(b) stamp or seal documents or records.

(2) An ASET permit holder shall affix its permit number on documents or records in accordance with the professional technologist regulations.

2007 c13 s14

013539

Exemption from municipal licence

91.6 No municipality has the power to require any professional technologist or ASET permit holder to obtain a licence from the municipality to engage in the practice of engineering or the practice of geoscience.

2007 c13 s14;2011 c3 s24

Liability to others

92(1) The relationship between an ASET permit holder engaged in the practice of engineering or geoscience and a person receiving the professional services of the ASET permit holder is subject to this Act, the professional technologist regulations and any other law applicable to the relationship between a professional technologist and a client.

(2) The relationship of a professional technologist to an ASET permit holder, whether as member, shareholder or employee of the ASET permit holder, does not affect, modify or diminish the application of this Act or the professional technologist regulations

(a) to the professional technologist personally as a professional technologist, or

(b) to the relationship between the professional technologist and the professional technologist's client.

2007 c13 s14;2011 c3 s32

Division 4
Other ASET Members

Registers

92.1(1) In addition to the ASET Registrar's other responsibilities, the ASET Registrar shall maintain in accordance with ASET bylaws and subject to the direction of ASET Council, a register for

(a) certified engineering technologists;

(b) any other class or category of membership in ASET.

(2) The ASET Registrar shall maintain a register for registered engineering technologists in accordance with Part 9 of the *General Regulation* (AR 150/99).

(3) The ASET Registrar shall enter in the appropriate register the name of a person who has paid the fee prescribed in ASET bylaws and who

(a) in the case of a certified engineering technologist, has been approved by the ASET Board of Examiners, or

(b) in the case of any other class or category of regulated member, has been approved by ASET Council.

(4) The ASET Registrar shall maintain, in the case of regulated members, a membership record in accordance with ASET bylaws.

2007 c13 s14

Registration of regulated members

92.2(1) The ASET Board of Examiners shall approve for registration as a regulated member an individual who has applied to the ASET Board of Examiners and is eligible under this Act and ASET regulations to become a regulated member.

(2) Sections 2(1), 3(1)(b)(i), 5(1) and 6(1)(b)(i) do not apply to a regulated member engaged in the practice of engineering or geoscience under the supervision of a professional member, a professional licensee or a professional technologist.

2007 c13 s14;2011 c3 s25

Evidence of registration

92.3 On entering the name of a regulated member in the register, the ASET Registrar shall issue to the regulated member a certificate of registration.

2007 c13 s14

Annual certificate

92.4(1) A regulated member shall pay to ASET the annual fee prescribed under ASET bylaws.

(2) The ASET Registrar shall issue an annual certificate in accordance with ASET bylaws to a regulated member

(a) whose registration is not under suspension, and

(b) who has paid the annual fee.

(3) Subject to this Act, an annual certificate entitles the regulated member to use the title granted to the regulated member during the year for which the annual certificate is issued.

2007 c13 s14

Entries in registers

92.5(1) The registration of a regulated member is suspended when the decision to suspend the registration is made in accordance with this Act.

(2) The ASET Registrar shall enter a memorandum of suspension of a registration in the appropriate register indicating

(a) the duration of the suspension, and

(b) the reason for the suspension.

(3) The registration of a regulated member is cancelled when the decision to cancel the registration is made in accordance with this Act.

(4) The ASET Registrar shall enter a memorandum of cancellation of a registration in the appropriate register.

(5) The ASET Registrar shall not remove from the registers any memorandum made under this section, except in accordance with ASET bylaws.

2007 c13 s14

List of registrants open to the public

92.6 The ASET Registrar shall maintain and, during regular office hours, permit any person to inspect a list of all the regulated members in good standing.

2007 c13 s14

Cancellation on request

93(1) The ASET Registrar shall not cancel the registration of a regulated member at that person's request unless the request for cancellation has been approved by ASET Council.

(2) When a request for cancellation of a registration is approved by ASET Council,

(a) the ASET Registrar shall cancel that registration, and

(b) the regulated member requesting the cancellation shall, on being notified of the approval, immediately surrender to the ASET Registrar

(i) the certificate of registration, and

(ii) the annual certificate.

(3) ASET Council may direct the ASET Registrar to reinstate in the applicable register a registration that was cancelled under this section, subject to any conditions that ASET Council may prescribe, and to reissue the certificate of registration and annual certificate.

(4) Notwithstanding subsection (3), if a person whose registration is cancelled applies to be reinstated more than 7 years after the date of the cancellation, the application for reinstatement must be referred to the ASET Board of Examiners.

2007 c13 s14

013541

ASET Board of Examiners

93.1(1) ASET Council shall establish a board of examiners in accordance with ASET regulations to be known as the ASET Board of Examiners.

(2) The ASET Board of Examiners shall consider applications for the registration of applicants as regulated members in accordance with this Part, ASET regulations and ASET bylaws and may

(a) approve the registration,

(b) refuse the registration, or

(c) defer the approval of registration until it is satisfied that the applicant has complied with a requirement made under this section.

(3) The ASET Board of Examiners may, in its discretion, require an applicant for registration

(a) to pass one or more examinations set by the ASET Board of Examiners,

(b) to obtain more experience of a kind satisfactory to the ASET Board of Examiners for a period set by the ASET Board of Examiners, or

(c) to pass one or more examinations and obtain more experience

before it approves the registration.

2007 c13 s14

Approval by the ASET Board of Examiners

93.2 The ASET Board of Examiners shall approve the registration as a regulated member of a person who proves to the satisfaction of the ASET Board of Examiners that

(a) the person is of good character and reputation, and

(b) the person meets the requirements of ASET regulations.

2007 c13 s14

Review by the ASET Appeal Board

93.3(1) The ASET Board of Examiners shall send a written notice of any decision made by it under this Division to the applicant.

(2) If the decision made by the ASET Board of Examiners is to refuse or defer registration of the applicant, reasons for the decision shall be sent in writing to the applicant.

(3) If the decision made by the ASET Board of Examiners is to approve the registration, the ASET Registrar shall publish a notice of approval in accordance with ASET bylaws.

(4) An applicant whose application for registration has been refused by the ASET Board of Examiners may, within 30 days after receiving a notice of refusal and the reasons for refusal, appeal the decision to the ASET Appeal Board by serving a notice of appeal on the ASET Registrar.

(5) On receiving a notice of appeal, the ASET Registrar shall set a date, time and place for the hearing of the appeal and notify the appellant, in writing, of the date, time and place.

(6) The appellant may appear with counsel and make representations to the ASET Appeal Board.

(7) On concluding the hearing, the ASET Appeal Board may make any decision the ASET Board of Examiners was authorized to make.

2007 c13 s14

ASET Practice Review Board

93.4 There is hereby established a board called the ASET Practice Review Board consisting of not fewer than 4 members who have a combination of knowledge and experience suitable for determining the academic qualifications and experience necessary for a person to continue to engage in practice as a regulated member.

2007 c13 s14

Powers of the ASET Practice Review Board

93.5(1) The ASET Practice Review Board

(a) shall, on its own initiative or at the request of ASET Council, inquire into

(i) the assessment of existing and the development of new educational standards and experience requirements that are to be conditions precedent to obtaining and continuing registration as a regulated member under this Act,

(ii) the evaluation of desirable standards of competence of regulated members generally,

(iii) the practice of regulated members generally, and

(iv) any other matter that ASET Council from time to time considers necessary or appropriate in connection with the exercise of its powers and the performance of its duties in relation to competence in practice of regulated members under this Act and ASET regulations,

and

(b) may conduct a review of the practice of a regulated member in accordance with this Act and ASET regulations.

(2) The ASET Practice Review Board shall report to and advise ASET Council with respect to any matter dealt with by it pursuant to subsection (1).

(3) A person requested to appear at an inquiry under this section by the ASET Practice Review Board is entitled to be represented by counsel.

(4) The ASET Practice Review Board may, after a review under this section with respect to a regulated member, make any order that the ASET Discipline Committee may make under section 63 or 64.

(5) The provisions of Part 5 with respect to an investigation by the ASET Investigative Committee apply to a review of a regulated member by the ASET Practice Review Board.

(6) The ASET Practice Review Board may at any time during an inquiry or review under this section recommend to the ASET Investigative Committee that the inquiry or review be conducted by the ASET Investigative Committee pursuant to Part 5.

(7) On receiving a recommendation under subsection (6), the ASET Investigative Committee may proceed with an investigation under Part 5 as if the recommendation were a written complaint.

(8) After each inquiry under this section, the ASET Practice Review Board shall make a written report to ASET Council on the inquiry and may make any recommendations to ASET Council that the ASET Practice Review Board considers appropriate in connection with the matter inquired into, with reasons for the recommendations.

(9) ASET Council may, if it considers it to be in the public interest to do so, direct that the whole or any portion of an inquiry by the ASET Practice Review Board under this section shall be held in camera.

2007 c13 s14

Appeal to ASET Appeal Board

94 A regulated member who is the subject of a hearing or a review by the ASET Practice Review Board may appeal any decision or order of the ASET Practice Review Board to the ASET Appeal Board as if it were a decision or order of the ASET Discipline Committee under Part 5.

2007 c13 s14

013543

ASET Appeal Board

94.1(1) There is hereby established an ASET Appeal Board consisting of the regulated members appointed by ASET Council in accordance with ASET regulations.

(2) A member of the ASET Appeal Board appointed under subsection (1) continues to hold office after the expiry of the member's term of office until the member is reappointed or the member's successor is appointed.

2007 c13 s14

Division 5
Discipline of Regulated Members

ASET Discipline Committee

94.2(1) ASET Council shall establish a discipline committee, to be known as the ASET Discipline Committee, the members of which shall be appointed in accordance with ASET regulations.

(2) ASET Council shall make regulations governing, subject to this Part and Part 5, the operation and proceedings of the ASET Discipline Committee, the designation of a chair, the appointment of members, acting members and members by virtue of their office and the procedures for filling vacancies in the offices of the chair and the membership, and prescribing the powers, duties and functions of the chair and the members.

(3) ASET Council may make regulations respecting the hearing of a matter under Part 5 by a panel of the ASET Discipline Committee.

(4) A regulation made under subsection (2) or (3) does not come into force unless it has been approved by the Lieutenant Governor in Council.

2007 c13 s14

ASET Investigative Committee

94.3(1) ASET Council shall establish an investigative committee to be known as the ASET Investigative Committee, the members of which shall be appointed in accordance with ASET regulations.

(2) ASET Council shall make regulations governing, subject to this Part and Part 5, the operation and proceedings of the ASET Investigative Committee, the designation of a chair, the appointment of members, acting members and members by virtue of their office and the procedures for filling vacancies in the offices of the chair and the membership, and prescribing the powers, duties and functions of the chair and the members.

(3) A regulation made under subsection (2) does not come into force unless it has been approved by the Lieutenant Governor in Council.

2007 c13 s14

Application of Part 5 to regulated members of ASET

94.4 Part 5, except sections 45 and 46, applies to regulated members, subject to the following changes to Part 5:

(a) "professional member" means a regulated member;

(b) "practice of the profession" means the practice of a regulated member;

(c) "Registrar" means the ASET Registrar;

(d) "the regulations" means ASET regulations;

(e) "Investigative Committee" means the ASET Investigative Committee;

(f) "Discipline Committee" means the ASET Discipline Committee;

(g) "Appeal Board" means the ASET Appeal Board;

(h) "bylaws" means ASET bylaws;

(i) "Council" means ASET Council;

013544

(j) "investigation panel" means an investigation panel established by the ASET Investigative Committee under section 47;

(k) "Association" means ASET;

(l) "Practice Review Board" means the ASET Practice Review Board;

(m) "register" means the ASET register of regulated members.

2007 c13 s14

Division 6
General

ASET Registrar's certificate

94.5(1) A certificate purporting to be signed by the ASET Registrar and stating that a named person was or was not, on a specified day or during a specified period,

(a) a regulated member,

(b) a professional technologist,

(c) an officer of ASET or a member of ASET Council, or

(d) a member of a joint board or committee that is established by this Act,

shall be admitted in evidence as proof, in the absence of evidence to the contrary, of the facts stated in it without proof of the ASET Registrar's appointment or signature.

(2) A certificate purporting to be signed by the ASET Registrar and stating that a named corporation, partnership or other association of persons was or was not, on a specified day or during a specified period, an ASET permit holder shall be admitted in evidence as proof, in the absence of evidence to the contrary, of the facts stated in it without proof of the ASET Registrar's appointment or signature.

2007 c13 s14

Protection from liability

95(1) No action lies against

(a) any person conducting a preliminary investigation, the ASET Registrar, a member of the ASET Discipline Committee, the ASET Practice Review Board, the ASET Investigative Committee, the ASET Appeal Board, ASET Council, the ASET Board of Examiners or ASET or any person acting on the instructions of any of them,

(b) any member, officer or employee of ASET, or

(c) any person conducting a preliminary investigation, a member of the Joint Discipline Committee, the Joint Practice Review Board, the Joint Investigative Committee, the Joint Appeal Board, the JPT Regulations Committee or the Joint Board of Examiners or any person acting on the instructions of any of them

for anything done by that person or entity in good faith and in purporting to act under this Act, ASET regulations, ASET bylaws or the professional technologist regulations.

(2) No action for defamation may be founded on a communication that consists of or pertains to a complaint regarding the conduct of a regulated member or a professional technologist if the communication is published to or by

(a) ASET,

(b) a member of ASET Council, the ASET Discipline Committee, the ASET Practice Review Board, the ASET Investigative Committee, the ASET Appeal Board or the ASET Board of Examiners,

(c) a person conducting a preliminary investigation,

(d) an officer or employee of ASET,

013545

(e) a member of the JPT Regulations Committee, the Joint Discipline Committee, the Joint Practice Review Board, the Joint Investigative Committee, the Joint Appeal Board or the Joint Board of Examiners, or

(f) a person acting on the instructions of any of the persons or entities referred to in clauses (a) to (e),

in good faith in the course of investigating the complaint or in the course of any proceedings under Part 5 relating to the complaint.

2007 c13 s14

Division 7
Prohibitions and Penalties

Practice prohibitions

95.1(1) A person whose registration as a professional technologist is cancelled or suspended under this Act shall not, without the consent of the Joint Board of Examiners, engage in the practice of engineering or geoscience or directly or indirectly associate in the practice of engineering or geoscience with any professional member, licensee, permit holder, certificate holder or professional technologist.

(2) No person, except a regulated member entitled to do so, shall

(a) use the title "certified engineering technologist" or the abbreviation "C.E.T." or other abbreviations of that title;

(b) represent or hold out, expressly or by implication, that the person is entitled to use the title or abbreviation referred to in clause (a) as a certified engineering technologist;

(c) use the title "registered engineering technologist" or the abbreviation "R.E.T." or other abbreviations of that title.

(3) ASET may hold or continue to hold, and regulate the use of, the following trademarks:

(a) certified engineering technologist and "C.E.T.";

(b) certified technician and "C. Tech";

(c) certified computer information technologist and "C.C.I.T.";

(d) applied science technologist and "A. Sc.T.".

(4) ASET has no legal capacity to apply for, be granted, or to hold, a trademark for any name, title, designation, initials or abbreviation other than those specified in subsection (3) without the consent of the Lieutenant Governor in Council.

(5) No person shall use the title "registered professional technologist", "registered professional technologist (engineering)", "registered professional technologist (geological)", "registered professional technologist (geophysical)" or "registered professional technologist (geoscience)" or the abbreviation "R.P.T.", "R.P.T. (eng)", "R.P.T. (geo)", "R.P.T. (geol)" or "R.P.T. (geoph)".

2007 c13 s14;2011 c3 s26

Injunction

96 The Court, on application by ASET Council, may grant an injunction enjoining any person from

(a) doing any act or thing that contravenes section 95.1(1), (2) or (5), or

(b) using a title or abbreviation referred to in section 95.1(3) contrary to a use permitted by a trademark referred to in section 95.1(3),

notwithstanding any penalty that may be provided by this Act or under this Act in respect of that act, thing or use.

2007 c13 s14;2011 c14 s7

Onus of proof

96.1 In a prosecution under this Act, the burden of proving that a person is a professional technologist or a regulated member is on the accused.

2007 c13 s14

013546

Part 9
Prohibitions and Penalties

Practice prohibitions

97(1) A person whose registration as a professional engineer, professional geoscientist, licensee, permit holder or certificate holder is cancelled or suspended under this Act shall not, without the consent of the Council, engage in the practice of engineering or geoscience, as the case may be, or directly or indirectly associate the person or itself in the practice of engineering or geoscience with any other professional member, licensee, permit holder or certificate holder.

(2) No professional engineer, professional geoscientist, licensee, permit holder or certificate holder shall, except with the consent of the Council, associate in the practice of engineering or geoscience, as the case may be, directly or indirectly with or employ in connection with that practice a person whose registration has been cancelled or suspended under this Act.

(3) The Council may permit a professional member, licensee, permit holder or certificate holder to employ in connection with the person's practice a person whose registration has been cancelled or suspended under this Act, but the employment shall be in the capacity and subject to the terms and conditions that are prescribed by the Council.

RSA 2000 cE-11 s97;2011 c3 s27

Use of names and abbreviations relating to geology and geophysics

97.1(1) No individual, corporation, partnership or other entity, except

(a) an individual who is registered as a professional geoscientist and was registered as a professional geologist immediately before the coming into force of this subsection,

(b) an individual who is registered to engage in the practice of geoscience as a licensee and was registered to engage in the practice of geology as a licensee immediately before the coming into force of this subsection, or

(c) a corporation, partnership or other association of persons that is registered to engage in the practice of geoscience as a permit holder and was registered to engage in the practice of geology as a permit holder immediately before the coming into force of this subsection,

shall

(d) use the title "professional geologist", the abbreviation "P. Geol." or any other abbreviation of that title,

(e) use the word "geologist" in combination with any other name, title, description, letter, symbol or abbreviation that represents expressly or by implication that the individual, corporation, partnership or other entity is a professional geologist, licensee or permit holder, or

(f) represent or hold out, expressly or by implication, that the individual, corporation, partnership or other entity is a professional geologist.

(2) No individual, corporation, partnership or other entity, except

(a) an individual who is registered as a professional geoscientist and was registered as a professional geophysicist immediately before the coming into force of this subsection,

(b) an individual who is registered to engage in the practice of geoscience as a licensee and was registered to engage in the practice of geophysics as a licensee immediately before the coming into force of this subsection, or

(c) a corporation, partnership or other association of persons that is registered to engage in the practice of geoscience as a permit holder and was registered to engage in the practice of geophysics as a permit holder immediately before the coming into force of this subsection,

shall

(d) use the title "professional geophysicist", the abbreviation "P. Geoph." or any other abbreviation of that title,

(e) use the word "geophysicist" in combination with any other name, title, description, letter, symbol or abbreviation that represents expressly or by implication that the individual, corporation, partnership or other entity is a professional geophysicist, licensee or permit holder, or

013547

(f) represent or hold out, expressly or by implication, that the individual, corporation, partnership or other entity is a professional geophysicist.

(3) No individual, corporation, partnership or other entity, except

(a) an individual who is registered as a professional licensee (geoscience) and was registered as a professional licensee (geological) immediately before the coming into force of this subsection, or

(b) a corporation, partnership or other association of persons that is registered to engage in the practice of geoscience as a permit holder and was registered to engage in the practice of geology as a permit holder immediately before the coming into force of this subsection,

shall

(c) use the title "professional licensee (geological)" or any abbreviation of that title, or

(d) represent or hold out, expressly or by implication, that the individual, partnership or other entity is a professional licensee (geological).

(4) No individual, corporation, partnership or other entity, except

(a) an individual who is registered as a professional licensee (geoscience) and was registered as a professional licensee (geophysical) immediately before the coming into force of this subsection, or

(b) a corporation, partnership or other association of persons that is registered to engage in the practice of geoscience as a permit holder and was registered to engage in the practice of geophysics as a permit holder immediately before the coming into force of this section,

shall

(c) use the title "professional licensee (geophysical)" or any abbreviation of that title, or

(d) represent or hold out, expressly or by implication, that the individual, partnership or other entity is a professional licensee (geophysical).

(5) No individual, corporation, partnership or other entity, except an individual who is registered as a professional technologist (geoscience) and was registered as a professional technologist (geological) immediately before the coming into force of this subsection, shall

(a) use the title "professional technologist (geological)", the abbreviation "P. Tech (geol)" or any other abbreviation of that title, or

(b) represent or hold out, expressly or by implication, that the individual, partnership or other entity is a professional technologist (geological).

(6) No individual, corporation, partnership or other entity, except an individual who is registered as a professional technologist (geoscience) and was registered as a professional technologist (geophysical) immediately before the coming into force of this subsection, shall

(a) use the title "professional technologist (geophysical)", the abbreviation "P. Tech (geoph)" or any other abbreviation of that title, or

(b) represent or hold out, expressly or by implication, that the individual, partnership or other entity is a professional technologist (geophysical).

2011 c3 s28

Injunction

97.2 The Court, on application by the Council, may grant an injunction enjoining any person from doing any act or thing that contravenes section 97.1(1), (2), (3) or (4), notwithstanding any penalty that may be provided by this Act or the regulations in respect of that act or thing.

2011 c3 s28

013548

Penalties

98(1) Every person and every member, officer, employee or agent of a firm, partnership or other association of persons and of a corporation who contravenes Part 1, section 29(2)(b), section 39(4), section 83, 83.01, 83.1, 83.2, 83.3 or 86.3, this Part or section 89.3, 89.4, 89.5 or 95.1 is guilty of an offence and liable

(a) for the first offence, to a fine of not more than $2000,

(b) for the 2nd offence, to a fine of not more than $4000, and

(c) for the 3rd and each subsequent offence, to a fine of not more than $6000 or to imprisonment for a term of not more than 6 months or to both a fine and imprisonment.

(2) Repealed 2007 c13 s15.

(3) A prosecution under this section may be commenced within 2 years after the commission of the alleged offence, but not afterwards.

RSA 2000 cE-11 s98;2007 c13 s15;2011 c3 s29

Onus of proof

99 In a prosecution under this Act, the burden of proving that a person is a professional engineer, professional geoscientist, professional licensee (engineering), professional licensee (geoscience), registered professional technologist (engineering), licensee, permit holder or certificate holder, or that a person is not prohibited by section 97.1(1), (2), (3), (4), (5) or (6) from using a title, abbreviation or word or doing an act or thing, is on the accused.

RSA 2000 cE-11 s99;2011 c3 s30

Name change

100 If the name of the Alberta Society of Engineering Technologists is changed after April 29, 1999, the reference to the Alberta Society of Engineering Technologists is to be construed as a reference to the Alberta Society of Engineering Technologists by its new name.

1999 c8 s6

Part 10
Transitional Provisions

Existing registrations

101(1) Where, immediately before the coming into force of this subsection, an individual is registered as a professional geologist or professional geophysicist, on the coming into force of this subsection

(a) the individual is deemed to be registered as a professional geoscientist, and

(b) the certificate of registration as a professional geologist or professional geophysicist held by the individual is deemed to be a certificate of registration as a professional geoscientist.

(2) Where, immediately before the coming into force of this subsection, an individual is registered to engage in the practice of geology or geophysics as a licensee, on the coming into force of this subsection

(a) the individual is deemed to be registered to engage in the practice of geoscience as a licensee,

(b) the licence to engage in the practice of geology or geophysics as a licensee as authorized in the licence held by the individual is deemed to be a licence to engage in the practice of geoscience as authorized in the licence, and

(c) the authorization to engage in the practice of geology or geophysics contained in the licence held by the individual is to be construed as an authorization to engage in the practice of geoscience to an equivalent extent, and references in the authorization to the scope of practice of geology or geophysics are to be construed as references to the scope of practice of geoscience.

(3) Where, immediately before the coming into force of this subsection, a corporation, partnership or other association of persons is registered to engage in the practice of geology or geophysics as a permit holder, on the coming into force of this subsection

013549

(a) the corporation, partnership or other association of persons is deemed to be registered to engage in the practice of geoscience as a permit holder,

(b) the permit to engage in the practice of geology or geophysics as a permit holder as authorized in the permit held by the corporation, partnership or other association of persons is deemed to be a permit to engage in the practice of geoscience as authorized in the permit, and

(c) the authorization to engage in the practice of geology or geophysics contained in the permit held by the corporation, partnership or other association of persons is to be construed as an authorization to engage in the practice of geoscience to an equivalent extent and references in the authorization to the scope of practice of geology or geophysics are to be construed as references to the scope of practice of geoscience.

(4) Where, immediately before the coming into force of this subsection, an individual is registered as a professional licensee to engage in the practice of geology or geophysics within the scope of practice specified in the register, on the coming into force of this subsection

(a) the individual is deemed to be registered as a professional licensee to engage in the practice of geoscience within the scope of practice specified in the register,

(b) the certificate of registration to engage in the practice of geology or geophysics within the scope of practice specified in the certificate held by the individual is deemed to be a certificate of registration to engage in the practice of geoscience within the scope of practice specified in the certificate, and

(c) the scope of practice of geology or geophysics that is specified in the register and the certificate of registration as the scope of practice within which the individual is permitted to engage is to be construed as the scope of practice of geoscience within which the individual is permitted to engage.

(5) Where, immediately before the coming into force of this subsection, an individual is registered as a professional technologist to engage in the practice of geology or geophysics within the scope of practice specified by the Joint Board of Examiners, on the coming into force of this subsection

(a) the individual is deemed to be registered as a professional technologist to engage in the practice of geoscience within the scope of practice specified by the Joint Board of Examiners,

(b) the certificate of registration to engage in the practice of geology or geophysics within the scope of practice specified in the certificate held by the individual is deemed to be a certificate of registration to engage in the practice of geoscience within the scope of practice specified by the Joint Board of Examiners, and

(c) the scope of practice of geology or geophysics that is specified by the Joint Board of Examiners as the scope of practice for the professional technologist is to be construed as the scope of practice of geoscience for the professional technologist.

(6) Where, immediately before the coming into force of this subsection, a corporation, partnership or other association of persons is registered as an ASET permit holder to engage in the practice of geology or geophysics as an ASET permit holder within the scope of practice of those professional technologists who are responsible for the practice of the ASET permit holder, on the coming into force of this subsection the corporation, partnership or other association of persons is deemed to be registered as an ASET permit holder to engage in the practice of geoscience as an ASET permit holder within the scope of practice of those professional technologists who are responsible for the practice of the ASET permit holder.

(7) The Registrar or the ASET Registrar, as the case may be, shall make any necessary changes and take all necessary action to revise or create registers and records and issue certificates, licences, permits and other documentation to implement subsections (1) to (6).

2011 c3 s31

Use of titles and stamps relating to geology and geophysics

102(1) Subject to the regulations, where section 97.1(1), (2), (3), (4), (5) or (6) excepts an individual, licensee or permit holder from a prohibition against using a title, an abbreviation or a word or doing an act or thing, the individual, licensee or permit holder may use the title, the abbreviation or the word and may do the act or thing.

(2) Subject to the regulations and bylaws, an individual referred to in subsection (1) may use a stamp or seal bearing a title or abbreviation that the person is authorized by subsection (1) to use.

2011 c3 s31

Transitional regulations

103(1) The Lieutenant Governor in Council may make regulations

(a) respecting the transition of anything under this Act, including this Act as it read immediately before the coming into force of this section, relating to the transition from the profession of geology or the profession of geophysics to the profession of geoscience, including the interpretation of any transitional provision in this Act;

(b) to remedy any confusion, difficulty, inconsistency or impossibility resulting from the transition from the profession of geology or the profession of geophysics to the profession of geoscience.

(2) A regulation made under subsection (1) may be made retroactive to the extent set out in the regulation.

(3) A regulation made under subsection (1) is repealed on the earliest of

(a) the coming into force of an amendment that adds the subject-matter of the regulation to this Act;

(b) the coming into force of a regulation that repeals the regulation made under subsection (1);

(c) 3 years after the regulation comes into force.

(4) The repeal of a regulation under subsection (3)(b) or (c) does not affect anything done, incurred or acquired under the authority of the regulation before the repeal of the regulation.

Schedule

013555

Definitions

1 In this Regulation,

(a) "Act" means the Engineering and Geoscience Professions Act;

(b) "confirmatory examination" means an examination required by the Board of Examiners for the purpose of assessing an engineering or geoscience or related degree held by the applicant and not for a purpose related to the correction of perceived academic deficiencies;

(b.1) "domestic trade agreement" means a domestic trade agreement as defined in section 2 of Schedule 6 to the *Government Organization Act*;

(c) "licensee" includes a provisional licensee except where this Regulation specifically provides to the contrary.

AR 150/99 s1;72/2007;55/2012

Part 1
Membership in the Association

Division 1
General

Application

2(1) An application for registration must be submitted to the Registrar and must

(a) be in a form acceptable to the Board of Examiners, and

(b) be fully completed and accompanied by

(i) all required supporting documentation, and

(ii) any fees that are prescribed by the Council.

(2) The Registrar shall refer an application to the Board of Examiners if the application meets the requirements of subsection (1) and the Registrar is satisfied that the applicant meets the eligibility requirements for one of the categories of membership in the Association.

Annual fees

3 A person who is entered in a record or register under this Part shall pay any annual fees that are prescribed by the Council.

Non-payment

4 The Council may direct the Registrar to strike the name of a person from a record or register if the person fails to pay a prescribed fee.

Registers and records

5 The Registrar shall keep the following records and registers for the purposes of this Part:

(a) a record of students;

(b) a record of examination candidates;

(c) a record of members-in-training.

013556

Division 2
Students

Eligibility

6 A person who meets the following requirements and applies to the Registrar for registration is entitled to be enrolled as a student:

(a) the applicant is of good character and reputation;

(b) the applicant

(i) is enrolled in a full-time program at a university in Alberta that is recognized by the Board of Examiners as leading to a degree in engineering or geoscience, or

(ii) has at least 2 years of post-secondary education acceptable to the Board of Examiners in areas that relate to the science or technology of engineering or geoscience, together with

(A) one year of experience in work of an engineering or geoscientific nature acceptable to the Board of Examiners where the post-secondary education consists of an engineering or geoscientific technology program recognized by the Board of Examiners, or

(B) 3 years of such work experience, where the post-secondary education consists of education other than such a program.

AR 150/99 s6;55/2012

Striking from record

7 The Council may direct the Registrar to strike the name of a student from the record of students

(a) if the Council considers that the student has engaged in behaviour that constitutes unprofessional conduct,

(b) if the student ceases to be enrolled in a program referred to in section 6(b)(i), or

(c) if, in the opinion of the Board of Examiners, the student fails to make satisfactory progress toward registration as a professional member.

Division 3
Examination Candidates

Eligibility

8 A person who meets the following requirements and applies to the Registrar for registration is entitled to be admitted as an examination candidate:

(a) the applicant is of good character and reputation;

(b) the applicant is a graduate of

(i) a university program in engineering or geoscience, or

(ii) a related academic program that is acceptable to the Board of Examiners,

but the Board of Examiners has required the applicant to complete one or more confirmatory examinations or examinations for the purpose of correcting a perceived academic deficiency.

AR 150/99 s8;55/2012

Striking from record

9(1) The Council may direct the Registrar to strike the name of an examination candidate from the record of examination candidates

(a) if the Council considers that the examination candidate has engaged in behaviour that constitutes unprofessional conduct, or

(b) if, in the opinion of the Board of Examiners, the examination candidate fails to make satisfactory progress toward registration as a professional member.

(2) A person whose name is struck from the record is no longer eligible to proceed with the writing of examinations.

Division 4
Members-in-training

Eligibility

10(1) A person who meets the following requirements and applies to the Registrar for registration is entitled to be enrolled as an engineer-in-training or geoscientist-in-training:

(a) the applicant is of good character and reputation;

(b) the applicant

(i) is a graduate of a university program in engineering or geoscience or a related university program that is acceptable to the Board of Examiners, but does not have the work experience required for registration as a professional member, or

(ii) is registered as an examination candidate under section 8(b) and has completed the examinations referred to in that provision, but does not have the work experience required for registration as a professional member.

(2) Notwithstanding subsection (1), an applicant is entitled to be enrolled as an engineer-in-training or geoscientist-in-training if

(a) the applicant is of good character and reputation, and

(b) the applicant is registered and in good standing with a professional regulatory organization under an Act of another province or territory of Canada to perform an occupation that, in the opinion of the Board of Examiners, is substantially equivalent, in terms of scope of practice and competencies, to that of a member-in-training.

AR 150/99 s10;346/2009;55/2012

Domestic trade agreements

10.1 Where section 10(2) applies in respect of an applicant and the professional regulatory organization is in a province or territory that is a signatory to one or more domestic trade agreements that is in force in Alberta, the applicant's application must be dealt with in a manner consistent with the applicable domestic trade agreements.

AR 55/2012 s6

Time limits

11(1) Subject to subsection (2), no person may remain in the record of members-in-training for more than 6 years.

(2) The Council may in particular cases extend the period referred to in subsection (1) to not more than 8 years.

Professionally qualified persons inadmissible

12 No person may be enrolled as an engineer-in-training or geoscientist-in-training if at the time of application the person is qualified to be registered as a professional member or licensee.

AR 150/99 s12;55/2012

Division 5
Professional Members

Eligibility

13(1) A person who meets the following requirements and applies to the Registrar for registration is entitled to be registered as a professional member:

013558

(a) the applicant is a Canadian citizen or is lawfully admitted to Canada for permanent residence;

(b) the applicant is of good character and reputation;

(c) the applicant has a knowledge of the Act and the regulations under the Act, and general knowledge related to the practice of engineering or geoscience, which has been demonstrated by passing an examination that is prescribed by the Board of Examiners;

(d) the applicant demonstrates to the Board of Examiners that the applicant has a proficiency in the English language that is sufficient to enable the applicant to responsibly practise the profession of engineering or geoscience;

(e) the applicant meets one of the following requirements:

(i) the applicant is enrolled as a member-in-training and has obtained at least 4 years of experience in work of an engineering or geoscientific nature that is acceptable to the Board of Examiners;

(ii) the applicant is enrolled as a student under section 6(b)(ii) and

(A) has completed all examinations prescribed by the Board of Examiners, and

(B) has obtained at least 8 years of experience in work of an engineering or geoscientific nature that is acceptable to the Board of Examiners, at least one year of which is obtained after completion of the examinations referred to in paragraph (A);

(iii) the applicant is admitted as an examination candidate and

(A) has completed the examinations referred to in section 8(b), and

(B) has obtained at least 4 years of experience in work of an engineering or geoscientific nature that is acceptable to the Board of Examiners;

(iv) the applicant is not in a register or record referred to in subclause (i), (ii) or (iii), but has the combined academic qualifications and experience acceptable to the Board of Examiners that would be required for registration as a professional member had the applicant progressed through one of those registers or records.

(2) Notwithstanding subsection (1), an applicant is entitled to be registered as a professional member if

(a) the applicant is of good character and reputation, and

(b) the applicant is registered and in good standing with a professional regulatory organization under an Act of another province or territory of Canada to perform an occupation that, in the opinion of the Board of Examiners, is substantially equivalent, in terms of scope of practice and competencies, to that of a professional member.

AR 150/99 s13;37/2003;346/2009;55/2012

Domestic trade agreements

13.1 Where section 13(2) applies in respect of an applicant and the professional regulatory organization is in a province or territory that is a signatory to one or more domestic trade agreements that is in force in Alberta, the applicant's application must be dealt with in a manner consistent with the applicable domestic trade agreements.

AR 55/2012 s9

Division 6
Licensees

Registration as licensee

14(1) A person who meets all of the requirements of section 13 for registration as a professional member, except the requirement set out in section 13(1)(a), is entitled to be registered as a licensee.

(2) Notwithstanding subsection (1), an applicant is entitled to be registered as a licensee if

013559

(a) the applicant is of good character and reputation, and

(b) the applicant is registered and in good standing with a professional regulatory organization under an Act of another province or territory of Canada to perform an occupation that, in the opinion of the Board of Examiners, is substantially equivalent, in terms of scope of practice and competencies, to that of a licensee.

AR 150/99 s14;72/2007;346/2009

Domestic trade agreements

14.01 Where section 14(2) applies in respect of an applicant and the professional regulatory organization is in a province or territory that is a signatory to one or more domestic trade agreements that is in force in Alberta, the applicant's application must be dealt with in a manner consistent with the applicable domestic trade agreements.

AR 55/2012 s10

Registration as a provisional licensee

14.1(1) The Board of Examiners may approve the registration of a person as a provisional licensee if

(a) the person is legally entitled to work in Canada, whether or not the person meets the requirements of section 13(1)(a),

(b) the person meets all of the other requirements of section 13 for registration as a professional member, except the requirement set out in section 13(1)(e),

(c) the person has academic qualifications and experience in work of an engineering or geoscientific nature that is acceptable to the Board of Examiners, and

(d) the Board of Examiners considers that it is appropriate to register the person as a provisional licensee.

(1.1) Notwithstanding subsection (1), an applicant is entitled to be registered as a provisional licensee if

(a) the applicant is of good character and reputation, and

(b) the applicant is registered and in good standing with a professional regulatory organization under an Act of another province or territory of Canada to perform an occupation that, in the opinion of the Board of Examiners, is substantially equivalent, in terms of scope of practice and competencies, to that of a provisional licensee.

(2) A provisional licensee may practise engineering or geoscience only under the supervision and control of

(a) a professional member,

(b) a licensee, other than a provisional licensee, or

(c) a registered professional technologist

who has appropriate training and experience in the same area of practice.

(3) A provisional licensee may not vote in any matter affecting the Association or hold office in the Association.

(4) Subjection to subsection (5), no person may remain in the register of provisional licensees for more that 2 years.

(5) The Council may, in a particular case, extend the time period in subsection (4) to not more than 4 years where the Council considers it appropriate to do so.

AR 72/2007 s3;346/2009;55/2012

Domestic trade agreements

14.2 Where section 14.1(1.1) applies in respect of an applicant and the professional regulatory organization is in a province or territory that is a signatory to one or more domestic trade agreements that is in force in Alberta, the applicant's application must be dealt with in a manner consistent with the applicable domestic trade agreements.

AR 55/2012 s12

013560

Division 7
Board of Examiners

Board of Examiners - constitution

15(1) The Board of Examiners consists of

(a) an executive committee constituted under subsection (5),

(b) other members, who must be professional members, and who are appointed by the Council, and

(c) any other persons appointed by the Minister under the Act.

(2) The Board of Examiners shall meet at least twice each year to consider matters of policy, significant changes in procedure, examination results and other matters referred to it by its executive committee or the Council.

(3) The executive committee shall meet as is necessary to rule on applications for registration.

(4) The Council shall designate a person as chair of the Board of Examiners and that person shall also serve as chair of the executive committee.

(5) The executive committee of the Board consists of

(a) the deans of engineering at universities in Alberta, or persons designated by the deans,

(b) a senior professor, who must be a professional engineer, from each of the major engineering disciplines at universities in Alberta,

(c) a senior professor, who must be a professional geoscientist, from each of the departments of geoscience at universities in Alberta,

(d) repealed AR 55/2012 s13,

(e) other professional members of the Association equal to the number of members specified in clauses (a) to (c), who are not directly associated with any of the universities and are representative of the disciplines of engineering and geoscience,

(f) the Registrar of the Association or the Registrar's designate,

(g) one member of the public appointed by the Minister in accordance with section 30(2) of the Act, and

(h) 2 registered professional technologists (engineering) or engineering technologists appointed by the Minister under section 91 of the Act.

(6) Where the executive committee sits for the purposes of ruling on applications for registration, members appointed under subsection (5)(h) may sit only in respect of applications for registration as a registered professional technologist (engineering).

(7) The Council shall appoint the persons referred to in subsection (5)(b) to (e).

(8) The term of appointment for the chair and members of the Board of Examiners who are appointed by the Council is 3 years, and they may be reappointed.

(9) Where a vacancy occurs in a category of membership referred to in subsection (5)(a) to (f), the Council shall appoint a professional member to the position for the unexpired portion of the term.

(10) A quorum for a meeting of the Board of Examiners is 1/4 of the members of the Board.

(11) A quorum for a meeting of the executive committee of the Board of Examiners is 1/4 of the members of the executive committee.

AR 150/99 s15;8/2005;55/2012

013561

Part 2
Continuing Professional Development Program

Interpretation

15.1 In this Part, "licensee" does not include provisional licensee.

AR 72/2007 s4

Education program established

16(1) The Council establishes the Continuing Professional Development Program of the Association as the compulsory continuing education program for professional members and licensees.

(2) The Practice Review Board shall administer the Continuing Professional Development Program.

Mandatory compliance

17 A professional member or licensee shall comply with the requirements of the Continuing Professional Development Program as it applies to that person's practice of engineering or geoscience, as the case may be.

AR 150/99 s17;55/2012

Exemption

18(1) Notwithstanding section 17, a professional member or licensee who files with the Association a declaration in writing stating that that person is not actively engaged in the practice of a profession is exempt from the requirements of this Part.

(2) An exemption under this section is only effective for one year from the date the declaration is received by the Association but may be renewed for additional yearly periods.

(3) A professional member or licensee shall not engage in the practice of a profession while an exemption under this section is in effect.

(4) A professional member or licensee who has filed a declaration under subsection (1) must immediately notify the Association in writing if that person intends to resume the practice of the profession.

(5) The Practice Review Board may require a professional member or licensee who has notified the Association under subsection (4) to comply with any conditions that the Board may set prior to allowing that person to resume the practice of the profession.

Written records

19 A professional member or licensee must

(a) maintain a written record of activities undertaken in accordance with the Continuing Professional Development Program, and

(b) produce the record under clause (a) on the request of the Practice Review Board.

Striking from register

19.1 The Council may direct the Registrar to strike from the register of professional members or licensees the name of a person who fails to comply with a notice that is served on the professional member or licensee and direct the professional member or licensee to comply with section 19 within 30 days after the date of service of the notice.

AR 37/2003 s3

Proof of compliance

20(1) On the request of the Practice Review Board, a professional member or licensee must satisfy the Board that that person is complying with the requirements of the Continuing Professional Development Program.

(2) Where a professional member or licensee fails to satisfy the Practice Review Board under subsection (1), the Board may

013562

(a) conduct a review of the practice of that person in accordance with the Act and this Regulation, and

(b) at any time during a review recommend to the Investigative Committee that the review be conducted by the Investigative Committee under Part 5 of the Act as if the recommendation were a written complaint.

Part 3
Practice Review Board

Interpretation

20.1 In this Part, "licensee" does not include provisional licensee.

AR 72/2007 s5

Constitution

21(1) The Council shall appoint not fewer than 2 professional engineers and one professional geoscientist as members of the Practice Review Board.

(2) The Council shall designate one of the professional members as chair.

(3) The Registrar or the Registrar's designate shall serve as Secretary to the Practice Review Board.

(4) The chair and professional members must be appointed for a 3-year term, and may be reappointed.

(5) A quorum of the Practice Review Board is 4 of its members.

(6) Where a vacancy occurs in the Practice Review Board, other than with respect to the member of the public appointed under section 15(1)(b) of the Act, the Council shall appoint a professional member to the position for the unexpired portion of the term.

(7) In appointing professional members to the Practice Review Board under this section, the Council

(a) shall not appoint a professional member unless the professional member has at least 10 years of experience in the practice of the profession, and

(b) shall appoint professional members so that the membership will represent a combination of academic qualifications and experience such that the Practice Review Board can effectively review and assess registration requirements and procedures and disciplinary procedures in order to ensure the continuing competency of members of the Association, and advise the Council on those matters.

AR 150/99 s21;55/2012

Items considered

22(1) The Practice Review Board shall meet at least twice each year, and more frequently if the chair considers it necessary, to consider

(a) items referred to the Board by the Council, the Board of Examiners or the Discipline Committee,

(b) reports from the Registrar submitted under subsection (2),

(c) items that have come to the attention of the Board from other sources and that reflect a need to review the procedures of the Association with respect to registration, discipline or maintenance of professional competency, and

(d) any other items that may be considered by the Board pursuant to the Act.

(2) The Registrar shall submit at each regular meeting of the Practice Review Board a report setting out

(a) the number and nature of appeals and complaints relating to rulings of the Board of Examiners, and

(b) the number and nature of complaints dealt with under Part 5 of the Act and the disposition of the complaints, with special emphasis on cases reflecting on the competency of members of the Association.

013563

Investigation by Practice Review Board

23(1) If the Practice Review Board undertakes a review of the practice of a professional member, licensee, permit holder or certificate holder, it shall proceed with the review in accordance with this section.

(2) The Board shall appoint a person to conduct an initial review and report to the Board with respect to the substance of the conclusions on which the Board based its decision to commence an investigation.

(3) If, on receipt of the report, the Board decides that further investigation is not warranted, the Board shall discontinue the review and report its decision to the Council, along with any recommendations the Board considers appropriate.

(4) If, on receipt of the report, the Board decides that investigation of a specific practice is necessary, it shall

(a) issue notice of investigation to the professional member, licensee, permit holder or certificate holder if it is of the opinion that the matter to be investigated relates to matters other than to unskilled practice of the profession or unprofessional conduct, and proceed with its investigation in the same manner as provided for in a discipline investigation, or

(b) lodge an appropriate complaint with the Investigative Committee if it is of the opinion that further investigation may lead to a finding of unskilled practice of the profession or unprofessional conduct.

Report to Council

24 Following each meeting, the Practice Review Board shall report through its chair to the Council and may make any recommendations as to changes in procedures regarding registration, discipline or maintenance of competency that the Board considers appropriate.

Part 4
Council

President and Vice-presidents - election and powers

25(1) The President of the Association must be elected annually by the professional members of the Association, and holds office until a successor is elected.

(2) The President shall act as the presiding officer at meetings of the Council and at meetings of the Association.

(3) The President may vote at meetings of the Council or the Association only in the event of a tied vote.

(4) The 2 Vice-presidents must be elected annually by the professional members of the Association and must be designated as First Vice-president and Second Vice-president on the basis of the number of votes cast for each of them.

(4.1) The First Vice-president is deemed to be the President Elect and must be the sole nominee for the office of President in the succeeding year.

(5) The First Vice-president or, failing the First Vice-president, the Second Vice-president, has all the powers of the President during the absence of the President for any cause.

AR 150/99 s25;37/2003

Election of Council

26(1) The professional members of the Council, other than those mentioned in section 25, must be elected annually by the professional members of the Association.

(2) The term of the members referred to in subsection (1) is 3 years and the elections must be conducted so that as close as possible to 1/3 of the positions come up for election each year.

Vacancy

27(1) Where there is a vacancy in the Council, the remaining members of the Council shall appoint a professional member to fill the vacancy until the next regular election.

013564

(2) Where a vacancy is filled at a regular election, the person elected holds office for the unexpired portion of the term of office of the person being replaced.

Quorum

28 A quorum for meetings of the Council is

(a) at least one of the President, the 2 Vice-presidents or the immediate Past President, and

(b) 6 other professional members of the Council.

Executive Committee

29(1) There is hereby established an Executive Committee of the Council consisting of the President, who is the chair, the immediate Past President, the 2 Vice-presidents and the Executive Director of the Association.

(2) The Executive Committee has the delegated authority and power of the Council with respect to any decisions or actions necessary between Council meetings.

Other boards, committees and task forces

30(1) In addition to the Discipline Committee, Investigative Committee, Board of Examiners, Practice Review Board, Appeal Board and Executive Committee, the Council may appoint any other standing or special committees, task forces or boards that it considers necessary to serve the interests of the Association, and shall at the time of the appointment, delegate any authority it considers necessary for the committees, task forces or boards to perform their function.

(2) Except for the Discipline Committee, Investigative Committee, Board of Examiners, Practice Review Board, Appeal Board and Executive Committee, the Council shall determine the terms of reference for all committees, task forces or boards.

Part 5
Code of Ethics

Application and availability

31(1) Professional members, licensees, permit holders, members-in-training, examination candidates and students shall comply with the Code of Ethics in the Schedule to this Regulation.

(2) The Association shall publish interpretations of the rules comprising the Code of Ethics and distribute them to professional members, licensees, permit holders, members-in-training, examination candidates and students.

(3) The Association shall make the Code of Ethics available on request to members of the public.

Part 6
Discipline

Investigative Committee

32(1) There is hereby established an Investigative Committee consisting of professional members and registered professional technologists (engineering) or engineering technologists appointed by the Council and the member of the public appointed under section 33(1).

(2) The Council shall designate one professional member as the chair of the Investigative Committee.

(3) The chair or in the absence of the chair a majority of the members of the Investigative Committee may appoint an acting chair who has all the powers of the chair in the absence of the chair.

Public member

33(1) The Minister shall appoint one member of the public, from a list of persons nominated by the Council, to the Investigative Committee.

013565

(2) The Minister may, after consultation with the Council, revoke the appointment of the member of the public.

(3) The powers, duties and operations of the Investigative Committee are not affected by

(a) the failure of the Minister to appoint a member of the public,

(b) the revocation of the appointment of the member of the public,

(c) the resignation from the Investigative Committee of the member of the public, or

(d) the absence of the member of the public from a meeting of the Investigative Committee.

(4) The Minister may pay to the member of the public appointed to the Investigative Committee travelling and living expenses incurred by that member for attendance at meetings of the Investigative Committee away from the member's usual place of residence and fees in an amount prescribed by the Minister.

Term of office

34(1) The term of office of each member of the Investigative Committee is 3 years, and members may be reappointed.

(2) Where there is a vacancy in the membership of the Investigative Committee appointed by the Council, the Council may appoint a person to fill the vacancy for the unexpired portion of the term.

(3) Where there is a vacancy in the public membership on the Investigative Committee, the Minister may appoint a person to fill the vacancy for the unexpired portion of the term.

Quorum

35 A quorum of the Investigative Committee consists of the chair or the acting chair and the number of professional members and registered professional technologists (engineering) or engineering technologists determined by the Council.

Discipline Committee

36(1) There is hereby established a Discipline Committee consisting of professional members appointed by the Council and the member of the public appointed under section 37(1).

(2) The Council shall designate one professional member as the chair of the Discipline Committee.

(3) The chair or in the absence of the chair a majority of the members of the Discipline Committee may appoint an acting chair who has all the powers of the chair in the absence of the chair.

Public member

37(1) The Minister shall appoint one member of the public, from a list of persons nominated by the Council, to the Discipline Committee.

(2) The Minister may, after consultation with the Council, revoke the appointment of the member of the public.

(3) The powers, duties and operations of the Discipline Committee are not affected by

(a) the failure of the Minister to appoint a member of the public,

(b) the revocation of the appointment of the member of the public,

(c) the resignation from the Discipline Committee of the member of the public, or

(d) the absence of the member of the public from a meeting of the Discipline Committee.

(4) The Minister may pay to the member of the public appointed to the Discipline Committee travelling and living expenses incurred by that member for attendance at meetings of the Discipline Committee away from the member's usual place of residence and fees in an amount prescribed by the Minister.

013566

Term of office

38(1) The term of office of each member of the Discipline Committee is 3 years, and members may be reappointed.

(2) Where there is a vacancy in the professional members on the Discipline Committee, the Council may appoint a person to fill the vacancy for the unexpired portion of the term.

(3) Where there is a vacancy in the public membership on the Discipline Committee, the Minister may appoint a person to fill the vacancy for the unexpired portion of the term.

Quorum

39 A quorum of the Discipline Committee consists of the chair or the acting chair and the number of professional members determined by the Council.

Appeal Board

40(1) The Council shall appoint professional members, including one Past President of the Association, as members of the Appeal Board.

(2) The Council shall designate one professional member as the chair of the Appeal Board.

(3) The chair or in the absence of the chair a majority of the members of the Appeal Board may appoint an acting chair who has all the powers of the chair in the absence of the chair.

Term of office

41(1) The term of office of each member of the Appeal Board appointed under section 40 is 3 years, and members may be reappointed.

(2) Where there is a vacancy in the membership of the Appeal Board appointed under section 40, the Council may appoint a professional member to fill the vacancy for the unexpired portion of the term.

Quorum

42 A quorum of the Appeal Board consists of the chair or the acting chair and the number of professional members determined by the Council.

Adjournment of investigation if court proceedings commenced

43 A preliminary investigation under Part 5 of the Act may be adjourned if the complaint that gave rise to the investigation is the subject of proceedings in the Provincial Court of Alberta or the Court of Queen's Bench of Alberta.

Assistance in conducting preliminary investigation

44 An investigation panel appointed under section 47 of the Act may employ any technical consultants and legal counsel it considers necessary to conduct a preliminary investigation.

AR 150/99 s44;8/2005

Panel of the Discipline Committee

45(1) A panel of the Discipline Committee must consist of at least 3 members of the Discipline Committee who are professional members.

(2) A member of the Discipline Committee who has been designated to act as a case manager under section 52(2) of the Act in respect of a matter must not sit as part of the panel of the Discipline Committee that is hearing the matter under section 53 of the Act.

(3) A panel of the Discipline Committee has all the powers and authority of the Discipline Committee.

AR 150/99 s45;8/2005

013567

Publication

46 The Discipline Committee or the Appeal Board may direct that reports of disciplinary investigations be published.

Reinstatement of disciplined individuals

47(1) A professional member or licensee whose registration has been cancelled or a permit holder whose permit has been revoked under Part 5 of the Act as a result of the disciplinary proceedings may apply to the Council to be reinstated.

(2) An application under subsection (1) may not be made until at least one year after the date on which the registration was cancelled or the permit was revoked, or from the date on which the Court made its order confirming or varying the decision of the Council.

(3) The Council may establish a Committee of Inquiry to consider the application for reinstatement and make recommendations to the Council.

(4) The Council may require the former professional member, licensee or permit holder to demonstrate by means prescribed by the Council that that person is competent to re-engage in the practice of engineering or geoscience.

(5) Where an application for reinstatement is not approved by the Council, no further application may be made by the former professional member, licensee or permit holder until at least one year after the date the Council ruled on the previous application.

AR 150/99 s47;55/2012

Part 7
Registration of Permit Holders

Interpretation

47.1 In this Part, "licensee" does not include a provisional licensee.

AR 72/2007 s6

Requirements for issue of permit

48(1) The Council may issue to a partnership, corporation or other entity a permit to practice engineering or geoscience in its own name if

(a) an application is made to the Registrar in the form and containing the information required by the Council,

(b) the application is accompanied with the fees prescribed by the Council,

(c) the Council is satisfied that the practice will be carried on under the direct personal supervision and responsibility of a full-time permanent employee or member of the partnership, corporation or other entity who is also a professional member or licensee and who is qualified by education and experience in the field of engineering or geoscience in which the partnership, corporation or other entity intends to engage, and

(d) the professional member or licensee certifies to the satisfaction of the Council that the partnership, corporation or other entity has in place and will follow a professional management plan that is appropriate to its professional practice.

(2) A permit expires one year after the date on which it is issued.

(3) When the Council issues a permit, it shall provide the permit holder with a permit number.

(4) No person shall use a permit number where the permit to which the number is assigned has been cancelled or suspended.

AR 150/99 s48;37/2003;55/2012

013568

Seminars

48.1 A professional member or licensee who accepts responsibility under section 48(1)(c) shall every 5 years attend a permit to practice seminar acceptable to the Council.

AR 37/2003 s6

Signing and sealing of documents

49 When the practice of engineering or geoscience is carried on by a partnership, corporation or other entity pursuant to a permit under section 48, all final plans, specifications, reports or documents of a professional nature must

(a) be signed by and be stamped or sealed with the stamp or seal of

(i) the professional member or licensee who prepared them or under whose supervision and control they were prepared, or

(ii) in the case of plans, specifications, reports or documents that were prepared by other persons, the professional member or licensee who thoroughly reviewed and accepted professional responsibility for them,

and

(b) show the permit number issued to the partnership, corporation or other entity under section 48.

AR 150/99 s49;55/2012

Notification to Association

50(1) A partnership, corporation or other entity practising pursuant to a permit under section 48 shall keep the Association advised of the name of the professional member or licensee referred to in that section.

(2) The professional member or licensee referred to in section 48 shall forthwith advise the Registrar if the professional member or licensee

(a) ceases to be the person accepting responsibility under that section, or

(b) is no longer able to provide the certification referred to in section 48(1)(d).

AR 150/99 s50;37/2003

Revocation of permit

51 The Council may revoke a permit issued under section 50 if the permit holder contravenes the Act, this Regulation or a term or condition of the permit.

AR 150/99 s51;8/2005

Name of firm

52 No partnership, corporation or other entity may be incorporated or registered in the Province of Alberta under a name including the words “Engineering”, “Geology”, “Geophysics” or “Geoscience”, or variations of those words, unless it holds and continues to hold a valid permit issued under section 48.

AR 150/99 s52;55/2012

Control and use of stamps and seals

53 The permit number issued to a permit holder may only be used by the professional members or licensees referred to in section 48(1)(c).

Waiver of compliance

53.1 The Council may, subject to any terms and conditions it considers appropriate, waive compliance with the requirements of sections 48(1)(d) and 48.1.

AR 37/2003 s8

013569

Part 8
General

Use of stamps and seals issued to members

54(1) A stamp or seal issued to a professional member or licensee must at all times remain under that person's direct control and must be applied by the professional member or licensee or by a person acting under the professional member's or licensee's immediate and direct control to all final plans, specifications, reports or documents of a professional nature

(a) that were prepared by the professional member or licensee or under the professional member's or licensee's supervision and control, or

(b) that were prepared by another person in circumstances where the professional member or licensee has thoroughly reviewed them and accepted professional responsibility for them.

(2) No person shall permit a stamp or seal to be physically located in a manner that would allow its use by a person other than the professional member or licensee to whom it was issued.

(3) When a stamp or seal is applied, the professional member or licensee to whom it was issued shall ensure that the stamp or seal is accompanied with that person's signature and the date on which the stamp or seal is applied.

(4) A stamp or seal may be applied to the cover page or final page of reports or documents in a manner that clearly indicates acceptance of professional responsibility for the reports or documents, without being applied to each page.

(5) A professional member or licensee shall not acquire a stamp or seal from any source other than the Registrar.

(6) A professional member or licensee shall only use a stamp or seal while that person is registered pursuant to this Regulation.

(7) Stamps and seals are the property of the Association and a person in possession of a stamp or seal shall surrender it to the Association on demand.

(8) A professional member or licensee may, with the approval of the Registrar, apply a computer generated facsimile of the stamp or seal if that person otherwise meets the requirements of the Act and this Regulation.

(9) In this section, "licensee" does not include a provisional licensee.

AR 150/99 s54;72/2007

Association publications

55 The Association shall issue on a regular basis as directed by the Council the publications known as *The Annual Report* and *The PEGG* for the general information of members on the affairs of the Association and the professions generally.

Publications on professional services

56 The Association may publish, on an annual basis or as directed by the Council, for the information of members and the public, conditions of engagement and surveys of professional fees for particular types of professional engineering and geoscientific services.

AR 150/99 s56;55/2012

Publications on professional services

57 The Association may publish a guide to the selection of professional engineers and geoscientists for consulting services to assist clients in the selection of professionally and legally qualified consultants and consulting firms.

AR 150/99 s57;55/2012

Publications on professional services

58 The Association may publish guides that define for clients the scope of professional services to be expected from a consulting engineer or geoscientist.

AR 150/99 s58;55/2012

013570

Publications on professional services

59 The Association may issue, on an annual basis or as directed by the Council, publications for the purpose of promoting high standards of professional services and adequate remuneration for those services, and the maintenance and improvement of the competency of members.

Membership register

60 The Association may publish from time to time as directed by the Council, a register, in a format directed by the Council, of professional members, licensees, permit holders, joint firms and restricted practitioners.

Service of notices

61(1) If notice is required to be given to a person under the Act, this Regulation or the bylaws, the notice is sufficiently given if

(a) it is served personally on the person,

(b) it is sent by prepaid mail to the person at the latest address provided to the Registrar by the person, or

(c) where the person has provided to the Registrar an electronic address for the purpose of receiving notices that meets the requirements of the Council, it is sent to the person by electronic transmission to that address.

(1.1) If a notice is served by electronic transmission in accordance with subsection (1), unless the contrary is proved, the service is presumed to be effected on the date on which the notice was transmitted.

(2) If notice is served by mail in accordance with subsection (1), unless the contrary is proved, the service is presumed to be effected

(a) 7 days from the date of mailing if the document is mailed to an address in Alberta, or

(b) 14 days from the date of mailing if the document is mailed to an address outside Alberta.

AR 150/99 s61;37/2003;72/2007

Enforcement Review Committee

62(1) There is hereby established an Enforcement Review Committee consisting of not fewer than 9 professional members appointed by the Council.

(2) The Council shall designate one member of the Committee as the chair.

(3) A member of the Committee may be appointed for a term of not more than 3 years and may be reappointed.

(4) A quorum of the Committee is the chair and 3 of its members.

(5) The chair may designate a member of the Committee as vice-chair, and the vice-chair may exercise all the powers of the chair in the absence of the chair.

(6) The Council may delegate to the Committee matters respecting the enforcement of compliance with Part 1 of the Act and this Regulation, subject to the directions of the Council.

AR 150/99 s62;37/2003

Part 9
Registered Engineering Technologists

Definition

63 In this Part, "registered engineering technologist" means a person who was registered as a registered engineering technologist under this Part immediately before the coming into force of the *Engineering, Geological and Geophysical Amendment Act, 2007*.

AR 150/99 s63;281/2009

013571

Transitional

63.1 Subject to the Act and the *ASET Regulation*, a person who was registered as a registered engineering technologist under this Part immediately before the coming into force of the *Engineering, Geological and Geophysical Amendment Act, 2007* continues to be so registered under section 63.2.

AR 281/2009 s3

Register to be maintained

63.2 For the purposes of section 92.1(2) of the Act, the ASET Registrar shall maintain a register for registered engineering technologists.

AR 281/2009 s3

64 to 72 Repealed AR 281/2009 s4.

Part 10
Professional Licensees

73 Repealed AR 281/2009 s6.

Application

74(1) An application for registration as a professional licensee must be submitted to the Registrar and must

(a) be in a form acceptable to the Board of Examiners, and

(b) be fully completed and accompanied by

(i) all required supporting documentation, and

(ii) any fees that are prescribed by the Council.

(2) The Registrar shall refer an application for registration as a professional licensee to the Board of Examiners if the application meets the requirements of subsection (1) and the Registrar is satisfied that the applicant meets the eligibility requirements for registration set out in section 77.

AR 150/99 s74;37/2003;281/2009

Annual fees

75 A person who is entered in a register of professional licensees shall pay any annual fees that are prescribed by the Council.

AR 150/99 s75;37/2003; 281/2009

Non-payment

76 The Council may direct the Registrar to strike the name of a person from a register of professional licensees if the person fails to pay a prescribed fee.

AR 150/99 s76;37/2003;281/2009

Eligibility

77(1) A person who meets the following requirements and applies to the Registrar for registration is entitled to be registered as a professional licensee:

(a) the applicant is of good character and reputation;

(b) the applicant has at least 2 years of post-secondary education acceptable to the Board of Examiners in areas that relate to the practice of engineering or geoscience;

(c) the applicant has a knowledge of the Act and regulations under the Act, and general knowledge related to the practice of engineering or geoscience, which has been demonstrated by passing an examination for those purposes that is prescribed by the Board of Examiners;

013572

(d) the applicant demonstrates to the Board of Examiners that the applicant has a proficiency in the English language that is sufficient to enable the applicant to responsibly practise the profession of engineering or geoscience;

(e) the applicant has obtained at least 6 years of experience in work of an engineering or geoscientific nature that is acceptable to the Board of Examiners, at least 2 of which are in the applicant's specific area of professional practice and were completed under the supervision and control of a professional member.

(2) Notwithstanding subsection (1), an applicant is entitled to be registered as a professional licensee if

(a) the applicant is of good character and reputation, and

(b) the applicant is registered as a professional licensee or in an equivalent capacity in good standing with a regulated entity in another province that, in the opinion of the Board of Examiners, is equivalent to the Association.

AR 150/99 s77;281/2009;55/2012

Domestic trade agreements

77.1 Where section 77(2) applies in respect of an applicant and the regulated entity is in a province that is a signatory to one or more domestic trade agreements that is in force in Alberta, the applicant's application must be dealt with in a manner consistent with the applicable domestic trade agreements.

AR 55/2012 s20

Application of regulations

78 Sections 16, 17, 18, 19, 20, 22, 23, 25, 26, 27, 28, 29, 30, 31, 32, 47, 48, 48.1, 49, 50, 51, 53, 54, 59, 60 and the Schedule apply in respect of professional licensees as if they were professional members.

AR 150/99 s78;37/2003;72/2007;281/2009

Part 11
Repeal and Expiry

Repeal

79 The *General Regulation* (AR 244/81) is repealed.

Expiry

79.1 For the purpose of ensuring that this Regulation is reviewed for ongoing relevancy and necessity, with the option that it may be repassed in its present or an amended form following a review, this Regulation expires on September 30, 2021.

AR 281/2009 s10;55/2012

80 Repealed AR 37/2003 s15.

013573

Schedule

CODE OF ETHICS

(established pursuant to section 20(1)(k) of the Engineering and Geoscience Professions Act)

Preamble

Professional engineers and geoscientists shall recognize that professional ethics is founded upon integrity, competence, dignity and devotion to service. This concept shall guide their conduct at all times.

Rules of Conduct

1 Professional engineers and geoscientists shall, in their areas of practice, hold paramount the health, safety and welfare of the public and have regard for the environment.

2 Professional engineers and geoscientists shall undertake only work that they are competent to perform by virtue of their training and experience.

3 Professional engineers and geoscientists shall conduct themselves with integrity, honesty, fairness and objectivity in their professional activities.

4 Professional engineers and geoscientists shall comply with applicable statutes, regulations and bylaws in their professional practices.

5 Professional engineers and geoscientists shall uphold and enhance the honour, dignity and reputation of their professions and thus the ability of the professions to serve the public interest.

Adopted by Authority of Section 19 of the Engineering and Geoscience Professions Act.

013577

Part 1
Head Office, Branches and Districts

Location

1(1) The Head Office of the Association shall be located in the City of Edmonton in the Province of Alberta.

(2) Council may establish such branches and districts as it deems necessary for the benefit of members of the professions concentrated in specific regions of the province. Constitution, structure and operation of the branches and districts shall be subject to the approval of the Council.

Part 2
Election of Council

Nominating Committee

2 A nominating committee shall be appointed at the annual meeting to serve for the ensuing year. The Committee shall consist of a minimum of 11 professional members of the Association, 1 of who shall be the retiring president, who shall be the chairman. Council shall fill any vacancies which may occur in this nominating committee.

Nominees

3(1) Not less than 150 days prior to the annual meeting the nominating committee shall submit to the Chief Executive Officer a list of nominees for Council, which shall include the president-elect as the sole nominee for president, 3 nominees for vice-president, and at least 3 more nominees for Councillors than there are vacancies to be filled on Council.

(2) Nominees for president or vice-president shall have served at least 1 year on the Council.

Nominees selection

4(1) The nominating committee, in selecting nominees, shall give due consideration to the composition of the Council as required by the Act, regulations and by-laws and to the geographical distribution and field of practice of the nominees.

(2) The written consent of the nominees to act if elected shall be secured and shall accompany the list of nominees submitted to the Chief Executive Officer.

(3) Not less than 120 days prior to the annual meeting the Chief Executive Officer shall distribute to each professional member, either directly by mail or via the Association publication known as the PEG, a list of the nominations made by the nominating committee.

Additional nominations

5 Additional nominations for any office or any offices, except the president may be made in writing by any 10 professional members. Such nominations shall reach the Chief Executive Officer properly endorsed not later than 90 days prior to the annual meeting and shall be accompanied by the written consent of the nominee or nominees to act if elected.

Conduct of elections

6(1) Elections shall be conducted by letter ballot.

(2) The names of all persons nominated for office shall be placed on the ballot form in groups relating to each office. The number**,** professional classification and term of Councillors to be elected shall be made clear on the ballot form. Ballot forms shall be mailed to the professional members by the Chief Executive Officer not later than 50 days prior to the annual meeting.

(3) Each professional member is entitled to one vote for one candidate for vice-president, and to vote for as many candidates as there are vacancies to be filled for Council, or for a lesser number.

(4) The poll shall close at noon on the 20th day prior to the annual meeting and no ballots received after that time shall be considered.

Electronic Voting

6.1 Notwithstanding Section 6, a member may vote electronically as prescribed by such terms and conditions established by Council from time to time and such vote shall be received and treated by the Association as having the same force and effect as if sent by letter ballot pursuant to Bylaw 6.

013578

Ballot counting committee

7(1) At least 20 days before the annual meeting the president shall appoint 6 professional members including a chairman to act as a ballot counting committee.

(2) This committee shall meet at a time and place designated by the president, but at least 15 days prior to the annual meeting, and shall receive then the package containing the ballots from the Chief Executive Officer.

(3) The envelope containing the ballots shall be opened by a member or members of the ballot counting committee who shall scrutinize and count the votes cast and keep a record thereof.

Counting of ballots

8(1) Of the candidates for the offices of vice-presidents, the one receiving the highest number of votes shall be elected first vice-president and the one receiving the second highest number of votes shall be elected second vice-president.

(2) The candidate elected as first vice-president shall be deemed to be the president-elect and shall be the sole nominee for the president in the succeeding year.

(3) The requisite number of persons who receive the highest number of votes for the office of Councillor shall be elected as Councillors for a term of 3 years. If there are any vacancies in Council to be filled the person or persons receiving the next highest number of votes for the office of Councillor shall be elected as Councillors for the balance of the unexpired term or terms to be filled, and as among them, the person or persons receiving the highest number of votes shall fill any vacancy or vacancies which have the longer unexpired term or terms.

(4) On completion of the counting of the ballots, the chairman of the ballot counting committee shall deliver to the president or the Chief Executive Officer the results of the poll, together with the ballots and tally sheets in a separate sealed package.

Results of election

9(1) Prior to the annual meeting, the president or the Chief Executive Officer shall inform the candidates in the election of the results of the balloting including the number of votes cast for each candidate.

(2) The results of the election shall be announced at the annual meeting by the chairman of the meeting.

(3) In case of equality of votes for any officer or Councillor, the president or, in the absence of the president, the chairman of the nominating committee shall cast the deciding vote.

Objection and recount

10(1) Any objection to the poll as announced will be valid only if made immediately after the announcement and a proper motion for a recount will then be in order. If such a motion is made and carried the chairman shall appoint a ballot counting committee of not less than 12 professional members who shall forthwith recount all ballots. Candidates may be present or represented at such recount.

(2) On completion of the recount the results shall be communicated in writing to the chairman who shall announce it to the annual meeting immediately. Such recount shall be final and binding.

(3) Following the announcement of the poll or of the recount, as the case may be, the ballots and any tally sheets shall be destroyed.

Failure to comply with procedures

11 In the event of any failure to comply with procedures relating to the election of members of Council, Council shall have the power to take any action it deems necessary to validate the nomination, the counting of the ballots or the election.

Part 3
Meetings of the Council

Council meetings

12(1) Council shall meet at the call of the president or on request in writing to the Chief Executive Officer signed by not less than 4 Councillors.

013579

(2) The time and place of Council meetings shall be fixed by the president or by the councillors, whichever called the meeting.

(3) Professional members of the Association shall be informed as to the time and place of Council meetings and may attend meetings of the Council as observers if advance notification of their attendance is given to the Chief Executive Officer.

(4) If any member of Council is unable to attend a meeting of Council he shall so inform the Chief Executive Officer or the executive secretary prior to the meeting.

(5) If any member of Council absents himself from 3 consecutive meetings of Council without the approval of Council, Council may declare his seat to be vacant.

Expenses

13 Members of Council and, at the discretion of Council, appointed representatives of the Association, members of committees of the Association, members invited for special purposes and the representatives of other organizations shall be paid the reasonable out of-pocket expense of attending meetings of the Council or of the Association or when travelling on business of the Association.

Honorarium President

13.1 An honorarium shall be paid to the President, or the President's nominee in an amount and under such conditions as may be determined by the Council from time to time.

Part 4
Representatives to and from other Organizations and Groups

Representatives on other organizations

14(1) Council may appoint professional members to represent the Association on the Engineering Faculty Councils and Science Faculty Councils of Universities in Alberta and shall appoint a director of the Canadian Council of Professional Engineers.

(2) Council may appoint a professional member to represent the Association on the Council, governing body, or committees of any other organization or association.

(3) Representatives appointed under the provisions of subsections (1) and (2) hereof, if not members of Council, may be invited by Council to attend meetings of Council and to take part in the proceedings of Council but shall not be entitled to vote on any question.

Representatives from other organizations

15(1) Council may invite any organization or association to appoint a member of its executive as a representative to sit with Council at such meetings of Council as Council may determine.

(2) Any representative appointed pursuant to subsection (1) hereof, if not a member of Council, may be invited by Council to attend meetings of Council and to take part in the proceedings of Council but shall not be entitled to vote on any question.

Part 5
Meetings of the Association

Annual meetings

16(1) An annual meeting of the Association shall be held in every calendar year with the period between such meetings not to exceed 18 months. At each annual meeting the Council shall submit a recommendation as to the date and place of the next annual meeting.

(2) Notice of the annual meeting shall be distributed, either directly by mail or via the Association publication known as the PEG, to all members at least 90 days in advance of the meeting.

(3) At the annual meeting of the Association a quorum shall consist of 60 professional members.

013580

Agenda

17(1) The following items of business shall be dealt with at the annual meeting:

(a) minutes of the last annual meeting and of any special meetings held since the last annual meeting;

(b) business arising from the minutes;

(c) address of the president,

(d) reports of representatives of the Association;

(e) reports of committees;

(f) auditor's report;

(g) appointment of auditor;

(h) new business;

(i) fixing of the date and place of the next annual meeting;

(j) announcement of the results of the annual election;

(k) objection, if any, to the election results as announced;

(1) appointment of the nominating committee.

(2) Any resolution carried at an annual meeting shall be considered at the next regular meeting of the Council.

Special meetings

18(1) Special meetings of the Association may be held when considered necessary by the Council or upon written request to the Chief Executive Officer signed by not less than 30 professional members of the Association. A special meeting summoned pursuant to the written request of the 30 or more professional members shall be held not more than 45 days after the request is received by the Chief Executive Officer.

(2) Written notice calling a special meeting of the Association shall be distributed to all members, directly either by mail or via the Association publication known as the PEG, at least 14 days in advance of the meeting and shall clearly state the object of the meeting, and no other business shall be transacted at the meeting.

(3) At any special meetings of the Association a quorum shall consist of 60 professional members.

(4) Any resolution carried at a special meeting shall be considered at the next regular meeting of the Council.

District meetings

19(1) District meetings of the Association may be held as approved by Council or as directed by the executive of a properly constituted Branch of the Association.

(2) Notice of a district meeting shall be distributed to all members resident in the district, either directly by mail or via the Association publication known as the PEG, at least 14 days in advance of the meeting.

(3) Council shall approve the holding of a district meeting of the Association on a request to the Chief Executive Officer signed by not less than 30 professional members of the Association.

(4) A quorum at a district meeting shall be 10 professional members.

(5) Any resolution carried at a district meeting shall be considered by Council at its next regular meeting.

Procedures at meetings

20(1) The proceedings at any meeting of the Association and of Council shall be governed by the rules laid down in the latest edition of Robert's Rules of Order, except as these by-laws may otherwise provide.

(2) Only professional members are entitled to vote at annual, district or special meetings of the Association.

013581

Part 6
Chief Executive Officer, Deputy Registrar

Responsibilities

21 (1) The Chief Executive Officer shall be a professional member of the Association and shall post a security bond at the expense of the Association in a sum to be fixed by Council.

(2) The Chief Executive Officer shall be in responsible charge, under Council, of all property of the Association and shall be responsible for the work of all employees of the Association.

(3) The Chief Executive Officer shall be responsible for

(a) the presentation of business and recording of proceedings at all meetings of the Association and of Council,

(b) conducting the correspondence of the Association and keeping full records thereof,

(c) the books and accounts of the Association and ensuring that all monies due the Association are collected and deposited with the funds of the Association,

(d) the drawing of cheques against the funds of the Association to be signed by the Chief Executive Officer and president or alternates approved by the Council,

(e) providing from time to time such information and reports as may be requested by Council, or which he deems necessary in the interest of the Association, and

(f) such other functions as are necessary or expedient for the proper administration of the Act, regulations and by-laws, and the affairs of the Association generally.

Deputy Registrar

22 The Council may appoint a Deputy Registrar who has all the powers and can perform all the duties of the Registrar under the Act, the regulations and the by-laws when the Registrar is absent or unable to act, or when there is a vacancy in the office of the Registrar.

Part 7
Finances of the Association

Auditing

23(1) The finances of the Association shall be audited annually as of the 31st day of December.

(2) The auditors shall be a firm of chartered accountants who shall be appointed annually at the annual meeting.

(3) The auditors shall submit a written report for the annual meeting, a copy of which shall be sent to members prior to the meeting either directly by mail or via one of the Association publications.

Fees

24(1) The annual fee for a professional member shall be as specified from time to time by Council and shall be payable in advance, on the anniversary date of the member's initial or current registration, subject to such discount, if any, as Council may from time to time direct.

(2) The registration fee shall consist of an administrative charge as established by Council from time to time plus any other fees payable with the application for registration.

(3) In the case of new applicants, the annual fee for the following 12 months shall be payable at the time of registration.

(4) The annual fee for a licensee shall be fixed by Council from time to time, and shall not be less than the annual fee for a professional member.

(5)(a) The annual fee for a permit holder shall be fixed by Council from time to time and shall be not less than the annual fee for the professional member or licensee assuming direct personal supervision of and responsibility for the practice of the permit holder.

(b) Council may, in its discretion, on application of a permit holder waive or reduce the annual fee.

013582

Part 8
Life and Honorary Members

Life Member

25(1) Council, may confer life membership in the Association upon any professional member who

(a) has been a professional member for 25 or more years; or has held equivalent registration in a jurisdiction recognized by the Association, and professional membership totalling a minimum of 25 years, of which at least the last 10 years have been with the Association, and

(b) has retired from the practice of the profession

(2) Notwithstanding Section 25(1), Council, in its sole discretion, may confer life membership in the Association upon any professional member it deems worthy.

(3) Subject to Section 25(1), life members retain all of the obligations, duties and privileges of professional membership and pay annual fees as may be specified by Council.

Honorary Life Member

26(1) Council, in its discretion by unanimous vote, may confer Honorary Life Membership in the Association upon any professional member who has rendered significant service to the Association.

(2) Honorary Life Members retain all of the obligations, duties and privileges of professional membership but are exempted from payment of annual fees.

Honorary Member

27(1) Council, in its discretion by unanimous vote, may confer honorary membership in the Association upon persons who have given eminent service to the profession. There shall at no time be more than 30 honorary members in the Association.

(2) Honorary membership may be revoked by unanimous vote of the Council for conduct considered detrimental to the profession.

(3) Honorary members do not have the right to vote on Association affairs, to call themselves professional members or create the impression that they are professional members, or to engage in the practice of engineering, geology or geophysics.

(4) Honorary members are not required to pay any annual fees.

Part 9
Committees

Procedures and appointments

28(1) Standing Committees, Task Forces, or Boards, appointed by the Council pursuant to the Act and Regulations, shall proceed in accordance with terms of reference and procedures designated by the Council at the time of appointment.

(2) The Chair and members of Standing Committees, Task Forces, and Boards shall be appointed by the Council or if the Council so directs, by the Chief Executive Officer.

(3) Members of Standing Committees, Task Forces, and Boards, shall be appointed by the Council or by Chairmen in consultation with the Chief Executive Officer with ratification by the Council.

Expenses

29 The Chairs and members of Standing Committees, Task Forces and Boards shall receive reimbursement of expenses incurred in performing their designated functions.

013583

Part 10
Scholarships and Benefit Programs

Program

30(1) The Council in its discretion may establish such scholarship or other educational incentive programs that it considers will serve the interests of the professions of engineering, geology or geophysics and shall decide from time to time the amount of financial support to be provided for such programs.

(2) The Council in its discretion may establish such other types of benefit programs that it considers will advance the welfare of the professions of engineering, geology or geophysics and shall decide from time to time the amount of financial support to be provided for such programs.

Part 11
Register of Members

Content

31(1) The Registrar shall be responsible for maintaining an up-to-date register providing a record of

(a) professional members,

(b) licensees,

(c) permit holders,

(d) Life Members, Honorary Life Members, and Honorary Members,

(e) members-in-training,

(f) examination candidates,

(g) students,

(h) joint firms, and

(i) restricted practitioners, and

(j) provisional licensees, and

(k) professional licensees.

(2) The Registrar shall be responsible for entering any memoranda in the register related to cancellations and suspensions and any subsequent modifications to such memoranda and shall advise the next regular meeting of the Council of any memoranda entered or modified.

Mailing addresses

32 Professional members, licensees, permit holders, professional licensees, provisional licensees, Life Members, Honorary Life Members, Honorary Members, members-in-training, examination candidates, students, joint firms and certificate holders shall provide the Registrar with their current mailing addresses and advise the Registrar forthwith in writing of any change in address.

Onus to respond

32.1 Professional members, licensees, permit holders, life members, professional licensees, provisional licensees, members in training, joint firms, or certificate holders, shall respond promptly and appropriately to any duly served communication of a regulatory nature received from the Association that contemplates a reply.

Part 12
Seals, Stamps and Certificates

Seals and stamps

33(1) Seals and stamps issued to professional members shall be in a form prescribed by the Council and shall show the professional category of the professional member as Professional Engineer or Professional Geoscientist.

013584

(2) Seals and stamps issued to licensees shall be in a form prescribed by the Council and shall show the professional category of the licensee as Professional Engineer or Professional Geoscientist and in addition shall carry the word "licensee",

(3) Stamps issued to permit holders shall be in a form prescribed by the Council and shall show the designation "Permit Holder".

(4) Stamps issued to joint firms shall be in a form prescribed by the Council and shall show the designation "Engineers and Architects" or "Architects and Engineers".

(5) Seals and stamps issued to professional licensees shall be in a form prescribed by the Council and shall show the designation “Professional Licensee (Engineering), or (Geoscience)” as the case may be.

Certificates

34(1) The Registrar shall issue to each professional member a certificate in a form prescribed by the Council signed by the president and Registrar showing the date of registration and the professional category in which the member is registered; and upon renewal an annual certificate.

(2) The Registrar shall issue to each licensee a license certificate in a form prescribed by the Council signed by the president and Registrar showing the date of registration and the professional category of the licensee; and upon renewal of the license an annual certificate in the form of a license renewal card.

(3) The Registrar shall issue to each permit holder a certificate in a form prescribed by the Council signed by the president and Registrar showing the permit number assigned to the permit holder and professional category in which the permit holder is entitled to practice; and upon renewal of the permit an annual certificate in the form of a permit renewal card.

(4) The Registrar shall issue to each restricted practitioner a certificate in a form prescribed by the Council signed by the president and Registrar and showing the date of registration and the restricted area of practice in which the certificate holder may engage; and upon renewal of registration as a restricted practitioner, an annual certificate in the form of a restricted practice renewal card.

(5) The Registrar shall issue to each professional licensee a certificate in a form prescribed by the Council, signed by the President and Registrar, and showing the date of registration and the area of practice in which the professional licensee may engage; and upon renewal of registration as a professional licensee an annual certificate in the form of a renewal card.

Surrender of seals, stamps and certificates

35 Professional members, licensees, permit holders, certificate holders, and professional licensees shall surrender to the Registrar, forthwith upon development of any of the following eventualities, any seals, stamps and certificates that have been issued to them:

(a) temporary withdrawal of the professional member, licensee, permit holder, certificate holder, or professional licensee from practice of the profession for a period estimated to exceed 1 year;

(b) resignation of the professional member, licensee, permit holder, certificate holder, or professional licensee from the Association;

(c) the suspension or cancellation of the professional membership, license, permit or certificate.

Part 13
Assessment of Costs for Hearings and Appeals

Content

36 Where the Discipline Committee, Practice Review Board or the Appeal Board orders an investigated person to pay the costs of the hearing, or the costs of the appeal, or both the costs of the hearing and the costs of the appeal, those costs may include all or any of the following costs and expenses:

(a) any honorarium, payment, or professional fees paid to a person retained to participate in the hearing or appeal;

(b) costs of any transcripts of evidence taken in the proceedings;

(c) costs of reproduction of all or any documents including drawings and plans relating to the proceedings;

(d) witness fees;

013585

(e) cost of renting rooms, renting recording equipment, or hiring a reporter to take transcript of the evidence;

(f) fees payable to the solicitor acting on behalf of the Association in the proceedings;

(g) any other expenses incurred that are attributable to the hearing or an appeal resulting from it.

Part 14
General

Voting by mail

37(1) The Council may direct that a mail vote be conducted on any matter related to the Association.

(2) Announcement of a mail vote giving full details of the matter to be voted upon must be made to all professional members at least 21 days in advance of the vote being taken and if objections to a mail vote are received by the Registrar in writing at least 3 days before the announced date of the vote from at least 30 professional members of the Association the matter shall be held over to a meeting of the Association.

(3) A vote by mail shall be declared valid if at least 10 percent of the professional members respond and the matter shall be declared carried or defeated on the basis of a simple majority of the votes returned.

(4) The results of a mail vote shall be considered by the Council at its next regular meeting.

Electronic Voting

37.1 For purposes of Bylaw 37, a mail vote shall be deemed to include electronic communications within such terms and conditions as may be prescribed from time to time by the Council of the Association and such vote shall be received and treated by the Association as having the same force and effect as if sent by mail under Bylaw 37.

Amendments to By–laws

38(1) Proposed amendments to by-laws shall be submitted to a properly convened meeting of the Association and shall not be effective unless approved by a majority of the professional members present and voting at the meeting, or shall be submitted to the professional members for a mail vote in accordance with section 37.

(2) If the proposed amendments are to be voted on at a meeting of the Association, full details of the proposed amendments shall be disclosed to all professional members at least 14 days in advance of the meeting.

Validation

39 When any act or thing under the provisions of these by-laws directed to be done within a limited time is not so done, or is not properly or effectually done, then anything actually done prior to such omission or improper or ineffectual act shall not be thereby vitiated, but shall remain in full effect and the Council, either prior or subsequent to such act not properly or effectually done or omitted, may extend the time for completing or perfecting such act or thing, which when completed or perfected, shall have the same effect as if done strictly in accordance with the provisions of these by-laws.

Professional Licensees

40 Sections 2, 5, 6, 7, 12(3), 16(3), 18, 19, 20, 37 and 38 of these Bylaws apply to professional licensees (engineering), and professional licensees (geoscience) as if they were professional members.

Definitions

1 In this Regulation,

(a) "Act" means the Engineering and Geoscience Professions Act;

(b) "certified technician" means an individual who holds a certificate of registration as a certified technician granted by the ASET Board of Examiners under the Act;

(c) "certified technologist" means an individual who holds a certificate of registration as a certified engineering technologist, applied science technologist or certified computer information technologist granted by the ASET Board of Examiners under the Act;

(c.1) "domestic trade agreement" means a domestic trade agreement as defined in section 2 of Schedule 6 to the *Government Organization Act*;

(d) "registered engineering technologist" means an individual who holds a certificate of membership as a registered engineering technologist under Part 9 of the *Engineering and Geoscience Professions General Regulation* (AR 150/99) immediately before the coming into force of this Regulation;

(e) "regulated member" means

(i) a certified technician,

(ii) a certified technologist, or

(iii) except in sections 13, 14 and 15(5) and (8), a registered engineering technologist.

AR 282/2009 s1;56/2012

Part 1
Membership in ASET

Division 1
General

Application

2(1) An application for registration must be submitted to the ASET Registrar and must

(a) be in a form acceptable to the ASET Board of Examiners, and

(b) be fully completed and accompanied by

(i) all required supporting documentation, and

(ii) any fees that are prescribed by ASET Council.

(2) The ASET Registrar shall refer an application to the ASET Board of Examiners if the application meets the requirements of subsection (1) and the ASET Registrar is satisfied that the applicant meets the eligibility requirements for one of the categories of membership in ASET.

Annual fees

3 A person who is entered in a record or register under this Part or Part 9 of the Engineering and Geoscience Professions General Regulation (AR 150/99) shall pay any annual fees that are prescribed by ASET Council pursuant to the ASET bylaws.

AR 282/2009 s3;56/2012

Non-payment

4 ASET Council may direct the ASET Registrar to strike the name of a person from a record or register if the person fails to pay a prescribed fee.

Registers and records

5 The ASET Registrar shall keep and maintain records and registers for regulated members and other ASET members.

013591

Division 2
Students

Eligibility

:

(a) the applicant is of good character and reputation;

(b) the applicant

(i) is enrolled as a full-time student in an applied science, information or engineering technology program that is recognized by the ASET Board of Examiners, or

(ii) is a regulated member who returns to full-time education in an applied science, information or engineering technology program that is recognized by the ASET Board of Examiners.

(2) The ASET Board of Examiners may establish what part, if any, of a program referred to in subsection (1) an applicant must have successfully completed in order to be enrolled as a student.

Striking from record

7 ASET Council may direct the ASET Registrar to strike the name of a student from the record of students

(a) if ASET Council considers that the student has engaged in behaviour that constitutes unprofessional conduct,

(b) if the student ceases to be enrolled in a program referred to in section 6(1)(b), or

(c) if the registration was entered in error in the register.

Division 3
Examination Candidates

Eligibility

8 A person who meets the following requirements and applies to the ASET Registrar for registration is entitled to be admitted as an examination candidate:

(a) the applicant is of good character and reputation;

(b) the applicant is a graduate of

(i) an applied science, information or engineering technology program that is recognized by the ASET Board of Examiners, or

(ii) a related academic program that is recognized by the ASET Board of Examiners,

but the ASET Board of Examiners has required the applicant to either complete educational upgrading, examinations or other assessment activities for the purpose of correcting a perceived academic deficiency or acquire additional experience in work of an applied science, information or engineering technology nature.

Striking from record

9(1) ASET Council may direct the ASET Registrar to strike the name of an examination candidate from the record

(a) if ASET Council considers that the examination candidate has engaged in behaviour that constitutes unprofessional conduct,

(b) if, in the opinion of the ASET Board of Examiners, the examination candidate fails to make satisfactory progress toward registration as a regulated member, or

(c) if the registration was entered in error in the register.

(2) Subject to subsection (3), no person may remain on the record of examination candidates for more than 5 years.

013592

(3) The ASET Registrar may extend the period referred to in subsection (2) to not more than a total of 7 years.

(4) A person whose name is struck from the record is no longer eligible to proceed with the educational upgrading, examinations or other assessment activities.

Division 4
Members-in-Training

Definition

10 In this Division, "member-in-training" means a technician-in-training or a technologist-in-training.

Eligibility

11(1) A person who meets the following requirements and applies to the ASET Registrar for registration is entitled to be admitted as a member-in-training:

(a) the applicant is of good character and reputation;

(b) the applicant is

(i) a graduate of an applied science, information or engineering technology program that is recognized by the ASET Board of Examiners, but does not have the work experience required for registration as a regulated member, or

(ii) is a member-in-training or the equivalent of a member-in-training in good standing with a regulated entity in another province that is in the opinion of the ASET Board of Examiners equivalent to ASET.

(2) Notwithstanding subsection (1), a person may not be admitted as a member-in-training if at the time of application the person is qualified to be registered as a regulated member.

Domestic trade agreements

11.1 Where section 11(1)(b)(ii) applies in respect of an applicant and the regulated entity is in a province that is a signatory to one or more domestic trade agreements that is in force in Alberta, the applicant's application must be dealt with in a manner consistent with the applicable domestic trade agreements.

AR 56/2012 s4

Striking from record

12(1) **ASET** Council may direct the ASET Registrar to strike the name of a member-in-training from the record of members-in-training

(a) if ASET Council considers that the member-in-training has engaged in behaviour that constitutes unprofessional conduct,

(b) if, in the opinion of the ASET Board of Examiners, the member-in-training fails to make satisfactory progress toward registration as a regulated member, or

(c) if the registration was entered in error in the register.

(2) Subject to subsection (3), no person may remain on the record of members-in-training for more than 4 years after graduation.

(3) The ASET Registrar may extend the period referred to in subsection (2).

Division 5
Regulated Members

Eligibility

13(1) A person who meets the following requirements and applies to the ASET Registrar for registration is entitled to be registered as a regulated member:

013593

(a) the applicant is a Canadian citizen or is lawfully entitled to work in Canada;

(b) the applicant is of good character and reputation;

(c) the applicant has a knowledge of the Act and the regulations under the Act, and general knowledge related to the practice of applied science, information or engineering technology, which has been demonstrated by passing an examination that is prescribed by the ASET Board of Examiners;

(d) the applicant demonstrates to the ASET Board of Examiners that the applicant has a proficiency in the English language that is sufficient to enable the applicant to responsibly practise the profession of applied science, information or engineering technology;

(e) the applicant meets one of the following requirements:

(i) the applicant has obtained at least 2 years of experience in work of an applied science, information or engineering technology nature that is acceptable to the ASET Board of Examiners;

(ii) the applicant is admitted as an examination candidate and

(A) has completed the educational upgrading, examinations or other assessment activities referred to in section 8(b), and

(B) has obtained at least 2 years of experience in work of an applied science, information or engineering technology nature that is acceptable to the ASET Board of Examiners;

(iii) the applicant has, in the opinion of the ASET Board of Examiners, through a combination of academic qualification and experience demonstrated the competence required for registration as a regulated member.

(2) Notwithstanding subsection (1), an applicant is entitled to be registered as a regulated member if

(a) the applicant is of good character and reputation, and

(b) the applicant is a regulated member or the equivalent of a regulated member in good standing with a regulated entity in another province that is in the opinion of the ASET Board of Examiners equivalent to ASET.

Domestic trade agreements

13.1 Where section 13(2) applies in respect of an applicant and the regulated entity is in a province that is a signatory to one or more domestic trade agreements that is in force in Alberta, the applicant's application must be dealt with in a manner consistent with the applicable domestic trade agreements.

AR 56/2012 s5

Designations

14(1) A person who meets the requirements for registration under section 13 and is entitled to be registered as a regulated member shall be granted one of the following designations as determined by the ASET Board of Examiners:

(a) certified technician;

(b) certified engineering technologist;

(c) applied science technologist;

(d) certified computer information technologist.

(2) Only those regulated members who are granted one of the designations as set out in subsection (1), and whose registration has not been cancelled or suspended, may use such designation or the following abbreviations:

(a) C. Tech;

(b) C.E.T.;

013594

(c) A.Sc.T.;

(d) C.C.I.T.

Division 6
ASET Board of Examiners

ASET Board of Examiners constitution

15(1) ASET Council shall appoint no more than 20 regulated members to the ASET Board of Examiners.

(2) The term of appointment for members of the Board of Examiners is 3 years, and they may be reappointed.

(3) ASET Council shall appoint a Chair and a Vice-Chair of the Board of Examiners.

(4) The term of office **for** the Chair and Vice-Chair is 3 years and they may be reappointed.

(5) The ASET Board of Examiners shall meet as is necessary to rule on applications for registration as a regulated member in accordance with section 93.1 of the Act.

(6) A quorum of the ASET Board of Examiners is one quarter of its members.

(7) The ASET Board of Examiners may appoint individuals from academic institutions and industry to a Panel of Examiners to advise the Board of Examiners on the academic qualifications of applicants.

(8) In addition to considering applications for registration as a regulated member, the ASET Board of Examiners shall meet as necessary to consider matters of policy, significant changes in procedure and other matters referred to it by ASET Council.

(9) The ASET Board of Examiners and the Panel of Examiners have the power to consult with any persons or organizations in order to properly assess the work experience and academic qualifications of applicants.

Part 2
Continuing Education Program and Practice Reviews

Division 1
Continuing Professional Development Program

Education program established

16(1) ASET Council establishes the Continuing Professional Development Program of ASET as the compulsory continuing education program for regulated members.

(2) The ASET Practice Review Board shall administer the Continuing Professional Development Program.

(3) The Continuing Professional Development Program comprises

(a) self-assessment by regulated members of their individual professional development needs,

(b) the preparation by regulated members of a continuing professional development plan,

(c) self-directed professional development activities,

(d) the ability of the ASET Practice Review Board to require that regulated members demonstrate compliance with the Continuing Professional Development Program, and

(e) practice visits in accordance with section 21(2)(a).

(4) ASET Council shall make rules governing the operation of the Continuing Professional Development Program, including, without limitation, the following:

013595

(a) the format of the Continuing Professional Development Plan;

(b) the approval of programs, courses and other learning activities that may be completed as part of the self-directed continuing professional development;

(c) declarations by regulated members that they have developed a Continuing Professional Development Plan and declarations with respect to the professional development activities that have been undertaken in accordance with the plan;

(d) audits of regulated members to ensure that Continuing Professional Development Plans have been prepared and that the professional development activities are being undertaken in accordance with the Continuing Professional Development Plan;

(e) the written records that must be maintained by regulated members with respect to their Continuing Professional Development Plan and activities undertaken in accordance with that plan.

(5) ASET Council may determine when the Continuing Professional Development Program comes into effect for regulated members.

Mandatory compliance

17 A regulated member shall comply with the requirements of the Continuing Professional Development Program as it applies to that person's profession of applied science, information technology or engineering technology.

Exemption

18(1) Notwithstanding section 17, a regulated member who files with ASET a declaration in writing stating that the person is not actively engaged in the practice of the profession set out in section 17 is exempt from the requirements of this Part.

(2) An exemption under this section is effective only for one year from the date the declaration is received by ASET, but may be renewed for additional yearly periods.

(3) A regulated member shall not engage in the practice of a profession while an exemption under this section is in effect.

(4) A regulated member who has filed a declaration under subsection (1) shall immediately notify ASET in writing if that person intends to resume the practice of the profession.

(5) The ASET Practice Review Board may require a regulated member who has notified ASET under subsection (4) to comply with any conditions that the Board may set prior to allowing that person to resume the practice of the profession.

Written records

19(1) In accordance with the rules established by ASET Council, regulated members shall develop and maintain written records of their Continuing Professional Development Plan and professional development activities.

(2) Regulated members shall produce the records under subsection (1) on the request of the ASET Practice Review Board.

Striking from register

20 ASET Council may direct the ASET Registrar to strike from the register of regulated members the name of a person who fails to comply with a request that is served on the regulated member under section 19(2).

Proof of compliance

21(1) On the request of the ASET Practice Review Board, a regulated member shall satisfy the Board that that person is complying with the requirements of the Continuing Professional Development Program.

(2) Where a regulated member fails to satisfy the ASET Practice Review Board under subsection (1), the Board may

(a) conduct a review of the practice of that person in accordance with the Act and this Regulation, including practice visits, and

013596

(b) at any time during a review recommend to the ASET Investigative Committee that the review be conducted by the ASET Investigative Committee under Part 8, Division 5 of the Act as if the recommendation were a written complaint.

Division 2
ASET Practice Review Board

ASET Practice Review Board constitution

22(1) ASET Council shall appoint not fewer than 4 regulated members as members of the ASET Practice Review Board.

(2) ASET Council shall designate one of the regulated members as chair.

(3) The ASET Registrar or the ASET Registrar's designate shall serve as Secretary to the ASET Practice Review Board.

(4) The chair and regulated members must be appointed for a 3-year term, and may be reappointed.

(5) A quorum of the Practice Review Board is a majority of its members.

(6) Where a vacancy occurs in the ASET Practice Review Board, ASET Council shall appoint a regulated member to the position for the unexpired portion of the term.

(7) In appointing regulated members to the ASET Practice Review Board under this section, ASET Council

(a) shall not appoint a regulated member unless the regulated member has at least 5 years of experience in the practice of the professions of applied science, information technology or engineering technology, and

(b) shall appoint regulated members so that the membership will represent a combination of academic qualifications and experience such that the ASET Practice Review Board can effectively review and assess registration requirements and procedures and disciplinary procedures in order to ensure the continuing competency of members of ASET, and advise ASET Council on those matters.

Items considered

23(1) The ASET Practice Review Board shall meet at least twice each year, and more frequently if the chair considers it necessary, to consider

(a) items referred to the ASET Practice Review Board by ASET Council, the ASET Board of Examiners or the ASET Discipline Committee,

(b) reports from the ASET Registrar submitted under subsection (2),

(c) items that have come to the attention of the ASET Practice Review Board from other sources and that reflect a need to review the procedures of ASET with respect to registration, discipline or maintenance of professional competency, and

(d) any other items that may be considered by the ASET Practice Review Board pursuant to the Act.

(2) The ASET Registrar shall submit at each regular meeting of the ASET Practice Review Board a report setting out

(a) the number and nature of appeals and complaints relating to rulings of the ASET Board of Examiners, and

(b) the number and nature of complaints dealt with under Part 8, Division 5 of the Act and the disposition of the complaints, with special emphasis on cases reflecting on the competency of members of ASET.

Investigation by ASET Practice Review Board

24(1) If the ASET Practice Review Board undertakes a review of the practice of a regulated member or permit holder, it shall proceed with the review in accordance with this section.

013597

(2) The ASET Practice Review Board shall appoint a person to conduct an initial review and report to the ASET Practice Review Board with respect to the substance of the conclusions on which the ASET Practice Review Board based its decision to commence an investigation.

(3) If, on receipt of the report, the ASET Practice Review Board decides that further investigation is not warranted, it shall discontinue the review and report its decision to ASET Council, along with any recommendations the ASET Practice Review Board considers appropriate.

(4) If, on receipt of the report, the ASET Practice Review Board decides that investigation of a specific practice is necessary, it shall

(a) issue notice of investigation to the regulated member or permit holder if it is of the opinion that the matter to be investigated relates to matters other than to unskilled practice of the profession or unprofessional conduct, and proceed with its investigation in the same manner as provided for in a discipline investigation, or

(b) lodge an appropriate complaint with the ASET Investigative Committee if it is of the opinion that further investigation may lead to a finding of unskilled practice of the profession or unprofessional conduct.

(5) For the purposes of conducting an investigation under this section, any or all of the members of the ASET Practice Review Board may, in order to ensure that continuing competence requirements are met, do one or more of the following:

(a) subject to subsection (6), at any reasonable time and on having given notice, conduct a practice visit by entering and inspecting any place where the regulated member works in the profession of applied science, information technology or engineering technology;

(b) interview a regulated member about the member's work in the profession of applied science, information technology or engineering technology;

(c) observe the regulated member working in the profession of applied science, information technology or engineering technology;

(d) interview or survey clients, co-workers, the regulated member's employer or the regulated member about the regulated member's work in the profession of applied science, information technology or engineering technology;

(e) review documents and examine substances and things that

(i) are owned by or under the control of the regulated member, and

(ii) are related to the work in the profession of applied science, information technology or engineering technology by the regulated member;

(f) assess the safety and condition of equipment and technology used by the regulated member.

(6) No member of the ASET Practice Review Board may enter a private dwelling place or any part of a place that is designed to be used and is being used as a permanent or temporary private dwelling place except with the consent of the occupant of the dwelling place.

Report to ASET Council

25 Following each meeting, the ASET Practice Review Board shall report through its chair to ASET Council and may make any recommendations as to changes in procedures regarding registration, discipline or maintenance of competency that the Board considers appropriate.

Part 3
ASET Council

President and Vice-presidents — election and powers

26(1) The President of ASET must be elected annually by the members of ASET in accordance with the bylaws and holds office until a successor is elected.

(2) The President shall act as the presiding officer at meetings of ASET Council and at meetings of ASET.

013598

(3) The President may vote at meetings of ASET Council or ASET only in the event of a tied vote.

(4) The 2 Vice-presidents must be elected annually by the members of ASET in accordance with the bylaws and hold office until a successor is elected.

(5) The First Vice-president or, failing the First Vice-president, the Second Vice-president, has all the powers of the President during the absence of the President for any cause.

Quorum

27(1) A quorum for meetings of ASET Council is a majority of its members.

Other boards, committees and task forces

28(1) In addition to the ASET Discipline Committee, ASET Investigative Committee, ASET Board of Examiners, ASET Practice Review Board, ASET Appeal Board and Executive Committee, ASET Council may appoint any other standing or special committees, task forces or boards that it considers necessary to serve the interests of ASET, and shall at the time of the appointment, delegate any authority it considers necessary for the committees, task forces or boards to perform their function.

(2) Except for the ASET Discipline Committee, ASET Investigative Committee, ASET Board of Examiners, ASET Practice Review Board, ASET Appeal Board and Executive Committee, ASET Council shall determine the terms of reference for all committees, task forces or boards.

Part 4
Code of Ethics

Application and availability

29(1) Regulated members shall comply with the Code of Ethics in the Schedule to this Regulation.

(2) ASET may publish interpretations of the rules comprising the Code of Ethics and distribute them to regulated members.

(3) ASET shall make the Code of Ethics available on request to members of the public.

Part 5
Discipline

Aware of unprofessional conduct

30 Despite not receiving a complaint under section 43 of the Act, but subject to section 43(3) of the Act, if the ASET Registrar has reasonable grounds to believe that the conduct of a regulated member or former member constitutes unprofessional conduct or unskilled practice, the ASET Registrar may treat the information as a complaint and act on it under section 43 of the Act.

Division 1
ASET Investigative Committee

ASET Investigative Committee

31(1) ASET Council shall appoint at least 3 regulated members to the ASET Investigative Committee.

(2) ASET Council shall designate one regulated member as the chair of the ASET Investigative Committee.

(3) The chair or, in the absence of the chair, a majority of the members of the ASET Investigative Committee may appoint an acting chair who has all the powers of the chair in the absence of the chair.

Public member

32(1) The Minister shall appoint one member of the public, from a list of persons nominated by the Council, to the ASET Investigative Committee.

013599

(2) The Minister may, after consultation with the Council, revoke the appointment of the member of the public.

(3) The powers, duties and operations of the ASET Investigative Committee are not affected by

(a) the failure of the Minister to appoint a member of the public,

(b) the revocation of the appointment of the member of the public,

(c) the resignation from the ASET Investigative Committee of the member of the public, or

(d) the absence of the member of the public from a meeting of the ASET Investigative Committee.

(4) The Minister may pay to the member of the public appointed to the ASET Investigative Committee travelling and living expenses incurred by that member for attendance at meetings of the ASET Investigative Committee away from the member's usual place of residence and fees in an amount prescribed by the Minister.

Term of office

33(1) The term of office of each member of the ASET Investigative Committee is 3 years, and members may be reappointed.

(2) Where there is a vacancy in the membership of the ASET Investigative Committee appointed by ASET Council, ASET Council may appoint a person to fill the vacancy for the unexpired portion of the term.

(3) Where there is a vacancy in the public membership on the ASET Investigative Committee, the Minister may appoint a person to fill the vacancy for the unexpired portion of the term.

Quorum

34 A quorum of the ASET Investigative Committee consists of a majority of its members.

Adjournment of investigation if court proceedings commenced

35 A preliminary investigation under Part 5 of the Act may be adjourned if the complaint that gave rise to the investigation is the subject of judicial proceedings.

Assistance in conducting preliminary investigation

36 An investigation panel appointed under section 47 of the Act may employ any technical consultants and legal counsel it considers necessary to conduct a preliminary investigation.

Division 2
ASET Discipline Committee

ASET Discipline Committee

37(1) ASET Council shall appoint at least 3 regulated members to the ASET Discipline Committee.

(2) ASET Council shall designate a regulated member as the chair of the ASET Discipline Committee.

(3) The chair or, in the absence of the chair, a majority of the members of the ASET Discipline Committee may appoint an acting chair who has all the powers of the chair in the absence of the chair.

Public member

38(1) The Minister shall appoint one member of the public, from a list of persons nominated by ASET Council, to the ASET Discipline Committee.

(2) The Minister may, after consultation with ASET Council, revoke the appointment of the member of the public.

(3) The powers, duties and operations of the ASET Discipline Committee are not affected by

(a) the failure of the Minister to appoint a member of the public,

(b) the revocation of the appointment of the member of the public,

(c) the resignation from the ASET Discipline Committee of the member of the public, or

(d) the absence of the member of the public from a meeting of the ASET Discipline Committee.

(4) The Minister may pay to the member of the public appointed to the ASET Discipline Committee travelling and living expenses incurred by that member for attendance at meetings of the ASET Discipline Committee away from the member's usual place of residence and fees in an amount prescribed by the Minister.

Term of office

39(1) The term of office of each member of the ASET Discipline Committee is 3 years, and members may be reappointed.

(2) Where there is a vacancy in the regulated members on the ASET Discipline Committee, ASET Council may appoint a person to fill the vacancy for the unexpired portion of the term.

(3) Where there is a vacancy in the public membership on the ASET Discipline Committee, the **Minister** may appoint a person to fill the vacancy for the unexpired portion of the term.

Quorum

40 A quorum of the ASET Discipline Committee consists of a majority of its members.

Panel of the ASET Discipline Committee

41(1) A panel of the ASET Discipline Committee must consist of at least 3 members of the ASET Discipline Committee.

(2) A member of the ASET Discipline Committee who has been designated to act as a case manager under sections 52(1) and 94.4 of the Act in respect of a matter must not sit as part of the panel of the ASET Discipline Committee that is hearing the matter under section 53 of the Act.

(3) A panel of the ASET Discipline Committee has all the powers and authority of the ASET **Discipline** Committee.

Right to counsel

42(1) The ASET Discipline Committee may be advised by counsel at a hearing before the ASET Discipline Committee.

(2) If the ASET Discipline Committee is advised by counsel acting on behalf of the ASET Discipline Committee at a hearing, that counsel may not lead or present evidence or argument at the hearing on behalf of ASET nor be the counsel of the ASET Registrar.

Division 3
ASET Appeal Board

ASET Appeal Board

43(1) ASET Council shall appoint at least 3 regulated members as members of the ASET Appeal Board.

(2) ASET Council shall designate one regulated member as the chair of the ASET Appeal Board.

(3) The chair or, in the absence of the chair, a majority of the members of the ASET Appeal Board may appoint an acting chair who has all the powers of the chair in the absence of the chair.

Term of office

44(1) The term of office of each member of the ASET Appeal Board appointed is 3 years, and members may be reappointed.

(2) Where there is a vacancy in the membership of the ASET Appeal Board appointed by ASET Council, ASET Council may appoint a regulated member to fill the vacancy for the unexpired portion of the term.

Quorum

45 A quorum of the ASET Appeal Board consists of a majority of its members.

Right to counsel

46(1) The ASET Appeal Board may be advised by counsel at an appeal hearing before the ASET Appeal Board.

(2) If the ASET Appeal Board is advised by counsel acting on behalf of the ASET Appeal Board at an appeal hearing, that counsel may not lead or present evidence or argument at the appeal hearing on behalf of the Investigative Committee nor be the counsel of the ASET Registrar or the Investigative Committee.

Division 4
General Matters

Publication

47 The ASET Discipline Committee or the ASET Appeal Board may direct that reports or summaries of disciplinary decisions, including the regulated member's personal information, be published in any manner it deems appropriate.

Reinstatement of disciplined individuals

48(1) A regulated member whose registration has been cancelled or a permit holder whose permit has been revoked under Part 5 of the Act as a result of the disciplinary proceedings may apply to ASET Council to be reinstated.

(2) An application under subsection (1) may not be made until at least one year after the date on which the registration was cancelled or the permit was revoked, or from the date on which the Court made its order confirming or varying the decision of ASET Council.

(3) ASET Council may establish an ASET Committee of Inquiry to consider the application for reinstatement and make recommendations to ASET Council.

(4) ASET Council may require the former regulated member or permit holder to demonstrate by means prescribed by ASET Council that that person is competent to re-engage in the practice of applied science, information or engineering technology.

(5) Where an application for reinstatement is not approved by ASET Council, no further application may be made by the former regulated member or permit holder until at least one year after the date ASET Council ruled on the previous application.

Part 6
General

Use of stamps and seals issued to members

49(1) A stamp or seal issued to a regulated member must at all times remain under that person's direct control and must be applied by the regulated member or by a person acting under the regulated member's immediate and direct control to all final plans, specifications, reports or documents of a professional nature

(a) that were prepared by the regulated member or under the regulated member's supervision and control, or

(b) that were prepared by another person in circumstances where the regulated member has thoroughly reviewed them and accepted professional responsibility for them.

(2) No person shall permit a stamp or seal to be physically located in a manner that would allow its use by a person other than the regulated member to whom it was issued.

(3) When a stamp or seal is applied, the regulated member to whom it was issued shall ensure that the stamp or seal is accompanied with that person's signature and the date on which the stamp or seal is applied.

(4) A stamp or seal may be applied to the cover page or final page of reports or documents in a manner that clearly indicates acceptance of professional responsibility for the reports or documents, without being applied to each page.

013602

(5) A regulated member shall not acquire a stamp or seal from any source other than the ASET Registrar.

(6) A regulated member shall only use a stamp or seal while that person is registered pursuant to this Regulation.

(7) Stamps and seals are the property of ASET and a person in possession of a stamp or seal shall surrender it to ASET on demand.

(8) A regulated member may, with the approval of the ASET Registrar, apply a computer-generated facsimile of the stamp or seal if that person otherwise meets the requirements of the Act and this Regulation.

Publications on professional services

50(1) ASET may publish, on an annual basis or as directed by ASET Council, for the information of members and the public,

(a) conditions of engagement and surveys of professional fees for particular types of applied science, information or engineering technology services,

(b) a guide to the selection of applied science, information or engineering technology members for consulting services to assist clients in the selection of professionally and legally qualified consultants and consulting firms,

(c) guides that define for clients the scope of professional services to be expected from regulated members, and

(d) publications for the purpose of promoting high standards of professional services and adequate remuneration for those services, and the maintenance and improvement of the competency of members.

Membership register

51 ASET may publish, from time to time as directed by ASET Council, a register, in a format directed by ASET Council, of regulated members and permit holders.

Service of notices

52(1) If notice is required to be given to a person under the Act, this Regulation or the ASET bylaws, the notice is sufficiently given if

(a) it is served personally on the person,

(b) it is sent by prepaid mail to the person at the latest address provided to the ASET Registrar by the person, or

(c) where the person has provided to the ASET Registrar an electronic address for the purpose of receiving notices that meets the requirements of ASET Council, it is sent to the person by electronic transmission to that address.

(2) If notice is served personally in accordance with subsection (1), unless the contrary is proved, the service is presumed to be effected

(a) if it is served personally on that person, or

(b) sent to that person by registered mail or courier at the address last shown for that person on the records of ASET.

(3) If personal service or service by prepaid mail under subsection (1) is not reasonably possible, the service is presumed to be effected by publishing the document or notice at least twice, not more than a week apart, in a local newspaper circulated at or near the latest address provided to the ASET Registrar by the person.

(4) If notice is served by mail in accordance with subsection (1), unless the contrary is proved, the service is presumed to be effected

(a) 7 days from the date of mailing if the document is mailed to an address in Alberta, or

(b) 14 days from the date of mailing if the document is mailed to an address outside Alberta.

(5) If a notice is served by electronic transmission in accordance with subsection (1), unless the contrary is proved, the service is presumed to be effected on the date on which the notice was transmitted.

013603

Expiry

53 For the purpose of ensuring that this Regulation is reviewed for ongoing relevancy and necessity, with the option that it may be repassed in its present or an amended form following a review, this Regulation expires on September 30, 2021.

AR 282/2009 s53;56/2012

Coming into force

54 This Regulation comes into force on the coming into force of the *Engineering, Geological and Geophysical Professions Amendment Act, 2007*.

013604

Schedule

Code of Ethics
(established pursuant to section 87.3(1)(j of the Engineering and Geoscienc Professions Act)

1 Regulated members shall

(a) hold paramount the safety, health and welfare of the public, the protection of the environment and the promotion of health and safety within the workplace,

(b) undertake and accept responsibility for professional assignments only when qualified by training and experience,

(c) provide an opinion on a professional subject only when it is founded upon adequate knowledge and honest conviction,

(d) act with integrity towards clients or employers, maintain confidentiality and avoid a conflict of interest, but where such conflict arises fully disclose the circumstances without delay to the employer or client,

(e) uphold the principle of appropriate and adequate compensation for the performance of their work,

(f) keep informed to maintain proficiency and competence, to advance the body of knowledge within their discipline and further opportunities for the professional development of their associates,

(g) conduct themselves with fairness, honesty, courtesy and good faith towards clients, colleagues and others, give credit where it is due and accept, as well as give, honest and fair professional comment,

(h) present clearly to employers and clients the possible consequences if professional decisions or judgments are overruled or disregarded,

(i) report to the appropriate agencies any hazardous, illegal or unethical professional decisions or practices by other members or others, and

(j) promote public knowledge and appreciation of applied science, information and engineering technology and protect ASET from misrepresentation and misunderstanding.

Definition

1 In this Regulation, "Act" means the Engineering and Geoscience Professions Act.

AR 283/2009 s1;57/2012

Part 1
Membership as a Professional Technologist

Division 1
General

Application

2(1) An application for registration as a professional technologist must be submitted to the ASET Registrar and must

(a) be in a form acceptable to the Joint Board of Examiners, and

(b) be fully completed and accompanied by

(i) all required supporting documentation, and

(ii) any fees that are prescribed by ASET Council pursuant to the ASET bylaws.

(2) The ASET Registrar shall refer an application to the Joint Board of Examiners if the application meets the requirements of subsection (1) and the ASET Registrar is satisfied that the applicant meets the eligibility requirements for registration as a professional technologist.

Annual fees

3 A person who is entered in a record or register under this Part shall pay any annual fees that are prescribed by ASET Council pursuant to the ASET bylaws.

Registers and records

4 The ASET Registrar shall keep and maintain records and a register of professional technologists, which shall be made available to the Registrar of the Association on request.

Division 2
Professional Technologists

Eligibility

5(1) A person who meets the following requirements and applies to the ASET Registrar for registration is entitled to be registered as a professional technologist:

(a) the applicant is of good character and reputation;

(b) the applicant holds a certificate of registration as a certified engineering technologist with ASET;

(c) the applicant has a knowledge of the Act and the regulations under the Act, and general knowledge related to the proposed scope of practice of engineering or geoscience, which has been demonstrated by passing an examination for those purposes that is prescribed by the Joint Board of Examiners;

(d) the applicant demonstrates to the Joint Board of Examiners that the applicant has a proficiency in the English language that is sufficient to enable the applicant to responsibly practice the profession of engineering or geoscience within the prescribed scope of practice;

(e) the applicant has at least 2 years of post-secondary education acceptable to the Joint Board of Examiners in areas that relate to engineering or geoscience;

(f) the applicant has obtained at least 6 years of experience in areas that relate to engineering or geoscience that is acceptable to the Joint Board of Examiners, at least 2 years of which are in the applicant's proposed area and scope of practice and were completed under the supervision and control of a professional member;

013609

(g) the applicant meets any other requirements established by the Joint Board of Examiners.

(2) Notwithstanding subsection (1), an applicant is entitled to be registered as a professional technologist if the applicant

(a) is of good character and reputation, and

(b) is a professional technologist who, in respect of another province,

(i) is eligible to engage in the practice of engineering or geoscience within the scope of practice specified by the Joint Board of Examiners, and

(ii) is a member in good standing with a regulated entity in that other province that, in the opinion of the Joint Board of Examiners, is equivalent to ASET.

AR 283/2009 s5;57/2012

Domestic trade agreements

5.1(1) In this section, "domestic trade agreement" means a domestic trade agreement as defined in section 2 of Schedule 6 to the *Government Organization Act.*

(2) Where section 5(2) applies in respect of an applicant and the regulated entity is in a province that is a signatory to one or more domestic trade agreements that is in force in Alberta, the applicant's application must be dealt with in a manner consistent with the applicable domestic trade agreements.

AR 57/2012 s3

Designations

6(1) A person who meets the requirements for registration in section 5 and is entitled to be registered as a professional technologist shall be granted one or more of the following designations as determined by the Joint Board of Examiners:

(a) professional technologist;

(b) professional technologist (engineering);

(c) professional technologist (geoscience).

(d) repealed AR 57/2012 s4.

(2) Only those persons who are granted one or more of the designations as set out in subsection (1), and whose registration has not been cancelled or suspended under Part 5 of the Act, may use such designation or the following abbreviations:

(a) P.Tech;

(b) P.Tech (eng.);

(c) P.Tech (geo).

(d) repealed AR 57/2012 s4.

AR 283/2009 s6;57/2012

Division 3
Joint Board of Examiners

Items considered

7(1) The Joint Board of Examiners shall meet as is necessary to rule on applications for registration in accordance with section 90.3 of the Act.

(2) In addition to considering applications for registration as a professional technologist, the Joint Board of Examiners shall meet as necessary to consider matters of policy, significant changes in procedure, examination results and any matters referred to it by any member of the Joint Board of Examiners or the Joint Councils Committee.

Joint Board of Examiners authority

8 The Joint Board of Examiners has the power to consult with any persons or organizations in order to properly assess the academic qualifications of applicants.

Part 2
Continuing Education Program and Practice Reviews

Division 1
Continuing Professional Development Program

Education program established

9(1) The Continuing Professional Development Program of ASET is established as a compulsory continuing education program for professional technologists.

(2) The Joint Practice Review Board shall administer the Continuing Professional Development Program.

(3) The Continuing Professional Development Program comprises

(a) self-assessment by professional technologists of their individual professional development needs,

(b) the preparation by professional technologists of a continuing professional development plan,

(c) self-directed professional development activities,

(d) the ability of the Joint Practice Review Board to require that professional technologists demonstrate compliance with the Continuing Professional Development Program, and

(e) practice visits in accordance with section 14(2)(a).

(4) ASET Council shall make rules governing the operation of the Continuing Professional Development Program, including, without limitation, the following:

(a) the format of the Continuing Professional Development Plan;

(b) the approval of programs, courses and other learning activities that may be completed as part of the self-directed continuing professional development;

(c) declarations by professional technologists that they have developed a Continuing Professional Development Plan and declarations with respect to the professional development activities that have been undertaken in accordance with the plan;

(d) audits of professional technologists to ensure that Continuing Professional Development Plans have been prepared and that the professional development activities are being undertaken in accordance with the Continuing Professional Development Plan;

(e) the written records that must be maintained by professional technologists with respect to their Continuing Professional Development Plan and activities undertaken in accordance with that plan.

(5) ASET Council may determine when the Continuing Professional Development Program comes into effect for professional technologists.

Mandatory compliance

10 A professional technologist shall comply with the requirements of the Continuing Professional Development Program as it applies to that person's practice.

Exemption

11(1) Notwithstanding section 10, a professional technologist who files with ASET a declaration in writing stating that the person is not actively engaged in the practice of the profession set out in section 10 is exempt from the requirements of this Part.

(2) An exemption under this section is effective only for one year from the date the declaration is received by ASET, but may be renewed for additional yearly periods.

(3) A professional technologist shall not engage in the practice of a profession while an exemption under this section is in effect.

(4) A professional technologist who has filed a declaration under subsection (1) shall immediately notify ASET in writing if that person intends to resume the practice of the profession.

(5) The Joint Practice Review Board may require a professional technologist who has notified ASET under subsection (4) to comply with any conditions that the Board may set prior to allowing that person to resume the practice of the profession.

Written records

12(1) In accordance with the rules established by ASET Council, professional technologists shall develop and maintain written records of their Continuing Professional Development Plan and professional development activities.

(2) Professional technologists shall produce the records under subsection (1) on the request of the Joint Practice Review Board.

Striking from register

13 ASET Council may direct the ASET Registrar to strike from the register of professional technologists the name of a person who fails to comply with a request that is served on the professional technologist under section 12(2).

Proof of compliance

14(1) On the request of the Joint Practice Review Board, a professional technologist shall satisfy the Board that that person is complying with the requirements of the Continuing Professional Development Program.

(2) Where a professional technologist fails to satisfy the Joint Practice Review Board under subsection (1), the Board may

(a) conduct a review of the practice of that person in accordance with the Act and this Regulation, including practice visits, and

(b) at any time during a review recommend to the Joint Investigative Committee that the review be conducted by the Joint Investigative Committee under Part 8 Division 5 of the Act as if the recommendation were a written complaint.

Division 2
Joint Practice Review Board

Items considered

15(1) The Joint Practice Review Board shall meet at least twice each year, and more frequently if the chair considers it necessary, to consider

(a) items referred to the Joint Practice Review Board by the Joint Councils Committee or the Joint Discipline Committee,

(b) reports from the ASET Registrar submitted under subsection (2),

(c)items that have come to the attention of the Joint Practice Review Board from other sources relating to the registration, discipline or maintenance of professional competency of professional technologists, and

(d) any other items that may be considered by the Joint Practice Review Board pursuant to the Act.

(2) The ASET Registrar shall submit at each regular meeting of the Joint Practice Review Board a report setting out

(a) the number and nature of appeals and complaints relating to rulings of the Joint Board of Examiners, and

(b) the number and nature of complaints dealt with by the Joint Discipline Committee and the disposition of the complaints, with special emphasis on cases reflecting on the competency of professional technologists.

Investigation by Joint Practice Review Board

16(1) If the Joint Practice Review Board undertakes a review of the practice of a professional technologist or permit holder, it shall proceed with the review in accordance with this section.

(2) The Joint Practice Review Board shall appoint a person to conduct an initial review and report to the Joint Practice Review Board with respect to the substance of the conclusions on which the Joint Practice Review Board based its decision to commence an investigation.

(3) If, on receipt of the report, the Joint Practice Review Board decides that further investigation is not warranted, it shall discontinue the review and report its decision to the Joint Councils Committee, along with any recommendations the Joint Practice Review Board considers appropriate.

(4) If, on receipt of the report, the Joint Practice Review Board decides that investigation of a specific practice is necessary, it shall

(a) issue notice of investigation to the professional technologist or permit holder if it is of the opinion that the matter to be investigated relates to matters other than to unskilled practice of the profession or unprofessional conduct, and proceed with its investigation in the same manner as provided for in a discipline investigation, or

(b) lodge a complaint with the Joint Investigative Committee if it is of the opinion that further investigation may lead to a finding of unskilled practice of the profession or unprofessional conduct.

(5) For the purposes of conducting an investigation under this section, any or all of the members of the Joint Practice Review Board may, in order to ensure that continuing competence requirements are met, do one or more of the following:

(a) subject to subsection (6), at any reasonable time and on having given notice, conduct a practice visit by entering and inspecting any place where the professional technologist works in the practice of engineering or geoscience;

(b) interview a professional technologist about the member's work in the profession of engineering or geoscience;

(c) observe the professional technologist working in the profession of engineering or geoscience;

(d) interview or survey clients, co-workers, the professional technologist's employer or the professional technologist about the professional technologist's work in the profession of engineering or geoscience;

(e) review documents and examine substances and things that

(i) are owned by or under the control of the professional technologist, and

(ii) are related to the work in the profession of engineering or geoscience by the professional technologist;

(f) assess the safety and condition of equipment and technology used by the professional technologist.

(6) No member of the Joint Practice Review Board may enter a private dwelling place or any part of a place that is designed to be used and is being used as a permanent or temporary private dwelling place except with the consent of the occupant of the dwelling place.

AR 283/2009 s16;57/2012

Report to Joint Councils Committee

17 Following each meeting, the Joint Practice Review Board shall report through its chair to the Joint Councils Committee and may make any recommendations as to changes in procedures regarding registration, discipline or maintenance of competency that the Board considers appropriate.

Part 3
Code of Ethics

Application and availability

18(1) Professional technologists shall comply with the Code of Ethics in the Schedule to this Regulation.

(2) ASET may publish interpretations of the rules comprising the Code of Ethics and distribute them to professional technologists and permit holders.

013613

(3) ASET shall make the Code of Ethics available on request to members of the public.

Part 4
Discipline

Aware of unprofessional conduct

19 Despite not receiving a complaint under section 43 of the Act, but subject to section 43(3) of the Act, if the ASET Registrar has reasonable grounds to believe that the conduct of a professional technologist or former member constitutes unprofessional conduct or unskilled practice, the ASET Registrar may treat the information as a complaint and act on it under section 43 of the Act.

Adjournment of investigation if court proceedings commenced

20 A preliminary investigation under Part 5 of the Act may be adjourned if the complaint that gave rise to the investigation is the subject of judicial proceedings.

Assistance in conducting preliminary investigation

21 An investigation panel appointed under section 47 of the Act may employ any technical consultants and legal counsel it considers necessary to conduct a preliminary investigation.

Non-participation of case manager in hearing

22 A member of the Joint Discipline Committee who has been designated to act as a case manager under section 52(2) of the Act in respect of a matter must not participate as part of the quorum of the Joint Discipline Committee that is hearing the matter under section 53 of the Act.

Right to counsel

23(1) The Joint Discipline Committee may be advised by counsel at a hearing before the Joint Discipline Committee.

(2) If the Joint Discipline Committee is advised by counsel acting on behalf of the Joint Discipline Committee at a hearing, that counsel may not lead or present evidence or argument at the hearing on behalf of ASET nor be the counsel of the ASET Registrar.

Right to counsel

24(1) The Joint Appeal Board may be advised by counsel at an appeal hearing before the Joint Appeal Board.

(2) If the Joint Appeal Board is advised by counsel acting on behalf of the Joint Appeal Board at an appeal hearing, that counsel may not lead or present evidence or argument at the appeal hearing on behalf of the Joint Investigative Committee nor be the counsel of the Registrar, the ASET Registrar or the Joint Investigative Committee.

Publication

25 The Joint Discipline Committee or the Joint Appeal Board may direct that reports or summaries of disciplinary decisions, including the professional technologist's personal information, be published in any manner it deems appropriate.

Reinstatement of disciplined individuals

26(1) A professional technologist whose registration has been cancelled or a permit holder whose permit has been revoked under Part 5 of the Act as a result of the disciplinary proceedings may apply to the Joint Councils Committee to be reinstated.

(2) An application under subsection (1) may not be made until at least one year after the date on which the registration was cancelled or the permit was revoked, or from the date on which the Court made its order confirming or varying the decision of the Joint Councils Committee.

(3) The Joint Councils Committee may establish a Committee of Inquiry to consider the application for reinstatement and make recommendations to the Joint Councils Committee.

013614

(4) The Joint Councils Committee may require the former professional technologist or permit holder to demonstrate by means prescribed by the Joint Councils Committee that that person is competent to re-engage in the practice of engineering or geoscience.

(5) Where an application for reinstatement is not approved by the Joint Councils Committee, no further application may be made by the former professional technologist or permit holder until at least one year after the date the Joint Councils Committee ruled on the previous application.

AR 283/2009 s26;57/2012

Part 5
Registration of Permit Holders

Requirements for issue of permit

27(1) ASET Council may issue to a partnership, corporation or other entity a permit to practice engineering or geoscience in its own name within the scope of practice of those professional technologists who are responsible for the practice of the ASET permit holder if

(a) an application is made to the ASET Registrar in the form and containing the information required by ASET Council,

(b) the application is accompanied with the fees prescribed by ASET Council pursuant to the ASET bylaws,

(c) ASET Council is satisfied that the practice will be carried on under the direct personal supervision and responsibility of a full-time permanent employee or member of the partnership, corporation or other entity who is also a professional technologist and who is qualified by education and experience in the field of engineering or geoscience in which the partnership, corporation or other entity intends to engage, and

(d) the professional technologist certifies to the satisfaction of ASET Council that the partnership, corporation or other entity has in place and will follow a professional management plan that is appropriate to the professional technologist's professional practice.

(2) A permit expires one year after the date on which it is issued.

(3) When ASET Council issues a permit, it shall provide the permit holder with a permit number.

(4) The permit shall include a statement that the permit holder is entitled to engage in the practice of engineering or geoscience within the scope of practice of those professional technologists who are responsible for the ASET permit holder.

(5) No person shall use a permit number where the permit to which the number is assigned has been cancelled or suspended.

(6) A professional technologist who accepts responsibility under subsection (1)(c) shall every five years attend a permit to practice seminar acceptable to ASET Council.

AR 283/2009 s27;57/2012

Signing and sealing of documents

28 When the practice of engineering or geoscience is carried on by a partnership, corporation or other entity pursuant to a permit under section 27, all final plans, specifications, reports or documents of a professional nature must

(a) be signed by and stamped or sealed with the stamp or seal of

(i) the professional technologist who prepared them or under whose supervision and control they were prepared, or

(ii) in the case of plans, specifications, reports or documents that were prepared by other persons, the professional technologist who thoroughly reviewed and accepted professional responsibility for them,

and

(b) show the permit number issued to the partnership, corporation or other entity under section 27.

AR 283/2009 s28;57/2012

013615

Notification to ASET

29(1) A partnership, corporation or other entity practising pursuant to a permit under section 27 shall keep ASET advised of the name of the professional technologist referred to in that section.

(2) The professional technologist referred to in section 27 shall forthwith advise the ASET Registrar if the professional technologist

(a) ceases to be the person accepting responsibility under that section, or

(b)is no longer able to provide the certification referred to in section 27(1)(d).

Revocation of permit

30 The Joint Councils Committee may revoke a permit issued under section 27 if the permit holder contravenes the Act, this Regulation or a term or condition of the permit.

Name of firm

31 No partnership, corporation or other entity may be incorporated or registered in the province of Alberta under a name including the words "Engineering", "Geology", "Geophysics" or "Geoscience", or variations of those words, unless it holds and continues to hold a valid permit issued under section 27.

AR 283/2009 s31;57/2012

Use of permit holder

32(1) The permit number issued to a permit holder may only be used by the professional technologist referred to in section 27(1)(c).

(2) ASET Council may, subject to any terms and conditions it considers appropriate, waive compliance with the requirements of section 27(1)(d) and (5).

Part 6
General

Seals and stamps

33(1) Seals and stamps issued to professional technologists must be in a form prescribed by ASET Council and shall show the professional category of the professional technologist as Engineering, Geology, Geophysics or Geoscience.

(2) Stamps issued to permit holders must be in a form prescribed by ASET Council and shall show the designation "Permit Holder".

AR 283/2009 s33;57/2012

Use of stamps and seals issued to members

34(1) A stamp or seal issued to a professional technologist must at all times remain under that person's direct control and must be applied by the professional technologist or by a person acting under the professional technologist's immediate and direct control to all final plans, specifications, reports or documents of a professional nature

(a) that were prepared by the professional technologist or under the professional technologist's supervision and control, or

(b)that were prepared by another person in circumstances where the professional technologist has thoroughly reviewed them and accepted professional responsibility for them.

(2) No person shall permit a stamp or seal to be physically located in a manner that would allow its use by a person other than the professional technologist to whom it was issued.

(3) When a stamp or seal is applied, the professional technologist to whom it was issued shall ensure that the stamp or seal is accompanied with that person's signature and the date on which the stamp or seal is applied.

(4) A stamp or seal may be applied to the cover page or final page of reports or documents in a manner that clearly indicates acceptance of professional responsibility for the reports or documents, without being applied to each page.

013616

(5) A professional technologist shall not acquire a stamp or seal from any source other than the ASET Registrar.

(6) A professional technologist shall only use a stamp or seal while that person is registered pursuant to this Regulation.

(7) Stamps and seals are the property of ASET and a person in possession of a stamp or seal shall surrender it to ASET on demand.

(8) A professional technologist may, with the approval of the ASET Registrar, apply a computer-generated facsimile of the stamp or seal if that person otherwise meets the requirements of the Act and this Regulation.

Service of notices

35(1) If notice is required to be given to a person under the Act, this Regulation or the ASET bylaws, the notice is sufficiently given if

(a) it is served personally on the person,

(b) it is sent by prepaid mail to the person at the latest address provided to the ASET Registrar by the person, or

(c) where the person has provided to the ASET Registrar an electronic address for the purpose of receiving notices that meets the requirements of ASET Council, it is sent to the person by electronic transmission to that address.

(2) If notice is served personally in accordance with subsection (1), unless the contrary is proved, the service is presumed to be effected

(a) if it is served personally on that person, or

(b) sent to that person by registered mail or courier at the address last shown for that person on the records of ASET.

(3) If personal service or service by prepaid mail under subsection (1) is not reasonably possible, the service is presumed to be effected by publishing the document or notice at least twice, not more than a week apart, in a local newspaper circulated at or near the latest address provided to the ASET Registrar by the person.

(4) If notice is served by mail in accordance with subsection (1), unless the contrary is proved, the service is presumed to be effected

(a) 7 days from the date of mailing if the document is mailed to an address in Alberta, or

(b) 14 days from the date of mailing if the document is mailed to an address outside Alberta.

(5) If a notice is served by electronic transmission in accordance with subsection (1), unless the contrary is proved, the service is presumed to be effected on the date on which the notice was transmitted.

Providing information

36 Professional technologists must notify the ASET Registrar immediately if there is a change to the name of the professional technologist, or of a change of address or other contact information that is required to be submitted when applying for registration or renewal of an annual certificate.

Expiry

37 For the purpose of ensuring that this Regulation is reviewed for ongoing relevancy and necessity, with the option that it may be repassed in its present or an amended form following a review, this Regulation expires on September 30, 2021.

AR 283/2009 s37;57/2012

Coming into force

38 This Regulation comes into force on the coming into force of the *Engineering, Geological and Geophysical Professions Amendment Act, 2007*.

013617

Schedule

Code of Ethics

(established pursuant to section 88.5(1)(h) of the Engineering and Geoscience Professions Act)

1 Professional technologists shall

(a) hold paramount the safety, health and welfare of the public, the protection of the environment and the promotion of health and safety within the workplace,

(b)undertake and accept responsibility for professional assignments only when qualified by training and experience,

(c) provide an opinion on a professional subject only when it is founded upon adequate knowledge and honest conviction,

(d)act with integrity towards clients or employers, maintain confidentiality and avoid a conflict of interest, but where such conflict arises fully disclose the circumstances without delay to the employer or client,

(e) uphold the principle of appropriate and adequate compensation for the performance of their work,

(f) keep informed to maintain proficiency and competence, to advance the body of knowledge within their discipline and further opportunities for the professional development of their associates,

(g) conduct themselves with fairness, honesty, courtesy and good faith towards clients, colleagues and others, give credit where it is due and accept, as well as give, honest and fair professional comment,

(h) present clearly to employers and clients the possible consequences if professional decisions or judgments are overruled or disregarded,

(i) report to the appropriate agencies any hazardous, illegal or unethical professional decisions or practices by other members or others, and

(j) promote public knowledge and appreciation of applied science, information and engineering technology and protect ASET from misrepresentation and misunderstanding.

Executive Summary

The safety of Canadians and protection of the environment is paramount for the National Energy Board (Board or NEB) when considering the performance of its regulated companies. The NEB requires regulated companies to anticipate, prevent, mitigate and manage any hazards and risks associated with their operations. The Board holds these companies accountable for safety and environmental outcomes in the public interest.

The NEB uses a risk-informed approach to identifying which regulated companies, facilities and activities require regulatory oversight, and which compliance tool is appropriate. Management Systems audits are an effective tool to proactively detect and correct a company's non-compliances before these non-compliances have any opportunity to grow and potentially impact public safety or environmental protection.

This report documents the Board's focused audit of TransCanada's Integrity Management Programs (IMPs) as they apply to its NEB-regulated pipeline facilities. The Board had previously scheduled an audit of TransCanada's Integrity Management Programs to start in the second quarter of 2013. As a result of allegations of regulatory non-compliance brought to the Board by a then employee of TransCanada (complainant), the Board advanced the timing of its audit and integrated an assessment of the allegations within the scope and technical protocols developed for the audit. The Integrity Management Program audit was conducted between November 2012 and August 2013.

Over the course of this audit, the Board conducted a detailed assessment of NEB management system requirements as they relate to TransCanada's integrity management programs. TransCanada was required to demonstrate the adequacy and effectiveness of its IMPs as well as its compliance with NEB requirements through interviews with company personnel, and the provision of adequate supporting documentation and records.

The Board's audit was conducted following its Audit Protocol, which identifies Management System elements. These elements are further broken down into sub-elements. Each sub-element reflects a number of regulatory requirements. The NEB requires companies to be fully compliant with one hundred percent of the regulatory requirements of a sub-element being assessed. If a company's program is found to be deficient with respect to any regulatory requirement, the entire sub-element will be found Non-Compliant.

The Board is of the view that the processes presently used by TransCanada have identified the majority, and most significant, of its hazards and risks.

The Board finds TransCanada to be compliant in five sub-elements of the audit, those being Organizational Structure, Roles and Responsibilities; Training, Competence and Evaluation; Operational Control-Normal Operations; Corrective and Preventive Actions; and Internal Audit.

The Board finds TransCanada to be non-compliant in four sub-elements of the audit, those being Hazard Identification, Risk Assessment and Control; Operational Control-Upset or Abnormal Operating Conditions; Inspection, Measurement and Monitoring; and Management Review.

With regards to concerns presented to the Board by the complainant, the audit has confirmed that in response to these allegations, TransCanada has developed and implemented a program of actions with the goal of correcting and preventing similar occurrences. The Board notes that a number of the allegations of regulatory non-compliance were identified and addressed by TransCanada only after the complainant's allegations were made and were not proactively identified by the company's management system. Details of the Board's assessment for each complainant allegation are contained in Element 4.4, Internal Audit, in Appendix II of this Final Audit Report.

The Board will make the Final Audit Report public and will post it to the Board's external website. TransCanada will be required to submit a Corrective Action Plan (CAP) to address the Non-Compliant findings identified through this audit, for approval, within 30 days of the Final Audit Report being issued by the Board. TransCanada's CAP will also be made public.

The Board will continue to monitor and assess all of TransCanada's corrective actions until they are fully implemented. The Board will also continue to monitor the overall implementation and effectiveness of TransCanada's IMPs and management system through targeted compliance verification activities as a part of its on-going regulatory mandate.

1.0 Audit Terminology and Definitions

Audit: A systematic, independent and documented process for obtaining evidence and evaluating it objectively to determine the extent to which audit criteria are fulfilled.

Corrective Action Plan (CAP): Addresses the non-compliances identified in the Audit Report and explains the methods and actions which will be used to "correct" them.

Compliant: A program element meets legal requirements. The company has demonstrated that it has developed and implemented programs, processes and procedures that meet legal requirements.

Finding: The evaluation or determination of the adequacy of programs or elements in meeting the requirements of the NEB Act and its associated regulations.

Non-Compliant: A program element does not meet legal requirements. The company has not demonstrated that it has developed and implemented programs, processes and procedures that meet the legal requirements. A corrective action must be developed and implemented.

Procedure: A documented series of steps followed in a regular and defined order allowing individual activities to be completed in an effective and safe manner. The procedure will also outline roles, responsibilities and authorities required for completing each step.

Process: A systematic series of actions or changes taking place in a definite order and directed towards a result.

Program: A documented set of processes and procedures to regularly accomplish a result. The program outlines how plans and procedures are linked, and how each one contributes towards the result.

2.0 Introduction: NEB Purpose and Framework

The NEB's purpose is to promote safety and security, environmental protection, and efficient energy infrastructure and markets in the Canadian public interest within the mandate set by Parliament in the regulation of pipelines, energy development and trade**.**

The NEB takes a proactive approach to management of hazards and risks. The NEB's compliance verification activities allow it to identify potential issues with regulated companies and, if necessary, address them with appropriate enforcement measures. Actions include conducting compliance verification activities such as inspections, compliance meetings, emergency exercises, investigations, and audits such as this one.

The NEB requires that each company be able to demonstrate the adequacy and implementation of the methods they have selected and employed in ordered to proactively identify and manage hazards and risks to achieve compliance. To evaluate compliance, the NEB undertakes audits of its regulated companies. Following the audits, companies are required to submit and implement a Corrective Action Plan (CAP) to address and mitigate non-compliances identified. The results of the audits are considered as a part of the NEB's risk-informed life cycle approach to compliance assurance.

A risk-informed approach enables the NEB to further assess and understand risks to public or worker safety and the environment as a result of pipeline operations. It also allows for public resources to be utilized in the most productive and responsible way possible.

The Board's audit was conducted following its Audit Protocol, which identifies Management System elements. These elements are further broken down into sub-elements. Each sub-element reflects a number of regulatory requirements. The NEB requires companies to be fully compliant with one hundred percent of the regulatory requirements of a sub-element being assessed. If a company's program is found to be deficient with respect to any regulatory requirement, the entire sub-element will be found Non-Compliant.

3.0 Background

Since November of 2012, NEB auditors and inspectors have visited field facilities and TransCanada's head office auditing the adequacy and effectiveness of TransCanada`s integrity management programs in order to assess its compliance with the *National Energy Board Act* (NEB Act)[1], other regulations and industry standards such as the Canadian Standards Association (CSA). The targeted audit was thorough and included all of TransCanada's NEB-regulated subsidiaries.

This audit constituted a focused assessment of TransCanada's IMPs as they apply to its NEB-regulated pipeline facilities. The audit scope addressed the following management system sub-elements as they relate to TransCanada's IMPs:

- Hazard Identification, Risk Assessment and Control;
- Organizational Structure, Roles and Responsibilities;
- Training, Competence and Evaluation;
- Operational Control-Normal Operations;
- Operational Control-Upset or Abnormal Operating Conditions;
- Inspection, Measurement and Monitoring;
- Corrective and Preventive Actions;
- Internal Audit; and
- Management Review.

The TransCanada subsidiaries included in the scope of this audit included specifically:

- TransCanada PipeLines Limited;
- TransCanada Keystone Pipeline GP Ltd.;
- Trans Québec & Maritimes Pipeline Inc.;
- Foothills Pipe Lines Ltd.; and
- NOVA Gas Transmission Ltd.

These subsidiaries hold the certificates for TransCanada's NEB-regulated facilities, which include the Canadian Mainline (operating under TransCanada Pipelines Limited), Keystone Pipeline (operating under TransCanada Keystone Pipeline GP Ltd.), TQM Pipeline System (operating under Trans Québec & Maritimes Pipeline Inc.), Foothills System (operating under Foothills Pipe Lines Ltd.), and the Alberta (NGTL) System (operating under NOVA Gas Transmission Ltd).

[1] On 17 July 2013, the NEB issued an updated Management System and Protection Program Audit Protocol. As this audit was ongoing at that time, it was continued under the former Audit Protocol, which is reproduced in Appendix II.

On 1 May 2012, the Board received a submission from a complainant outlining allegations of regulatory non-compliance against TransCanada. The Board initiated actions to investigate and confirm there were no immediate threats to public safety or the environment stemming from these allegations. In light of the concerns being brought forward, the Board advanced the timing of a TransCanada audit previously scheduled to begin in the 2nd quarter of 2013 and integrated an assessment of the allegations within the scope and technical protocol developed for that audit.

4.0 Audit Objectives and Scope

The scope of the audit included an assessment of whether TransCanada was fulfilling the requirements set out in:

- the NEB Act;
- the OPR-99[2];
- *CSA Z662-11, Oil and Gas Pipeline Systems*; and
- TransCanada's policies, practices and procedures.

More specifically, the audit examined nine sub-elements of the NEB management system requirements as they relate to TransCanada's integrity management programs. These sub-elements were selected using the Board's risk-informed approach to focus the scope of the audit on areas that have previously been shown to have the highest rates of non-compliance among NEB-regulated companies and to expedite and focus the assessment of the IMP technical programs in light of the allegations.

In order to assess compliance with the sub-elements, TransCanada was required to demonstrate the adequacy and effectiveness of its IMPs as well as its compliance with the requirements listed above through interviews with company personnel and the provision of adequate supporting documentation and records.

As noted, the audit protocol was modified to specifically evaluate the allegations of regulatory non-compliance brought to the Board by the complainant. This included, but was not limited to:

- confirmation that TransCanada's practices around welding inspections and non-destructive examination meet NEB requirements to be performed by a certified, third party reporting directly to TransCanada, independent of the contractors performing the work;

[2] On 10 April 2013, the OPR-99 was amended and renamed the *National Energy Board Onshore Pipeline Regulations* (OPR). As this audit was ongoing at that time, it was continued under the OPR-99 and all references in this audit report are to the OPR-99 unless otherwise noted. Development of IMPs is also required under the OPR and any Non-Compliant finding in this audit under OPR-99 would also be a Non-Compliant finding under the OPR. TransCanada was also audited to the requirements of CSA Z662-11, *Oil and Gas Pipeline Systems*. These requirements remained unchanged during the audit.

- examination of the revisions TransCanada has made to its internal practice of engineering guidance and determination as to whether or not it meets NEB requirements;
- evaluation of the specific remediation measures that have been implemented based on the findings in TransCanada's internal audit;
- determination of whether or not TransCanada's revised inspection processes meet the requirements set out in the OPR-99;
- evaluation of the new training program for inspectors on new non-destructive examination procedures to determine its adequacy; and
- review of the job description for the new Quality Assurance/Quality Control Manager and confirmation of his/her responsibilities.

5.0 Audit Process

On 8 November 2012, an opening meeting was conducted in Calgary, Alberta with representatives from TransCanada to discuss the Board's audit objectives, scope and the process, and to develop a schedule for conducting the staff interviews and site verifications. The interviews at TransCanada's head office and field verifications were carried out between November 2012 and July 2013. At the end of each day, daily summaries with action items were provided to TransCanada. On 27 August 2013, an Audit close-out meeting was conducted at the NEB office, where the results of the audit, including an outline of the draft audit non-compliances, were reviewed with TransCanada.

Since that time, the Board has been reviewing and assessing the information collected during the audit including written submissions, transcripts of interviews with company personnel, and the provision of adequate supporting documentation.

For a list of TransCanada representatives interviewed and meeting attendees, refer to Appendix III. For a list of documents and records reviewed, refer to Appendix IV.

6.0 Audit Results – Summary

The following summary represents a high-level overview of the Board's audit findings. The detailed findings of the NEB's assessments for each of the nine sub-elements of TransCanada's IMPs evaluated in this audit are provided in Appendix II. The Board's assessment of the complainant's allegations of regulatory non-compliance can be found in Appendix II, Sub-element 4.4 – Internal Audit.

Hazard Identification, Risk Assessment and Control

The Management System Audit Sub-Element 2.1, Hazard Identification, Risk Assessment and Control, refers to the regulations that require a company to have procedures to identify all possible hazards, to assess the degree of risk associated with the hazards and to implement control measures to minimize or eliminate risk.

TransCanada has implemented a system to identify and manage its operating and maintenance risk. Risks are calculated by incorporating the probability of events and the potential magnitude of the consequences. Records indicate that for pipelines and facilities, work is planned and risk-assessments are conducted with consideration given to safety, health, and the environment. TransCanada's process for threat identification was reviewed for all threats and was assessed to be compliant with the requirements.

The audit identified only one area of non-compliance in the sub-element of hazard identification, risk assessment and control. TransCanada developed a new management program for high pressure piping in gas facilities. This new program has been assessed and is adequate in terms of its content, but has not yet been fully implemented throughout all of TransCanada's facilities.

Management System Audit Sub-Element Finding: Based on the incomplete implementation of the required high pressure station piping program, TransCanada is assessed to be non-compliant with the requirements of the OPR-99 and CSA Z662-11, and is therefore non-compliant with this audit sub-element.

Organizational Structure, Roles and Responsibilities

The Management System Audit Sub-Element 3.1, Organizational Structure, Roles and Responsibilities, refers to the regulations that require a company to have an organizational structure that allows its management and protection programs to effectively function. It also requires companies to have clear roles and responsibilities, which may include responsibilities for the implementation of these programs.

TransCanada has approximately 310 employees performing work related to its integrity management programs across its Canadian pipeline system. This is complemented by approximately 80 field technicians who execute integrity-related activities.

The audit determined that for gas and liquid pipeline IMPs, roles and responsibilities are well-defined and have adequate, dedicated resources. The audit also assessed TransCanada's revised plant IMP, now known as the Facility, Integrity and Reliability Management Program (FIRM), and found that it addresses the roles and responsibilities that were lacking in the previous version.

Management System Audit Sub-Element Finding: Based on documents reviewed and interviews with personnel, TransCanada was able to demonstrate that it was in compliance with the requirements of the OPR-99 and CSA Z662-11, and is therefore compliant with the requirements of this audit sub-element.

Training, Competence and Evaluation

The Management System Audit Sub-Element 3.3, Training, Competence and Evaluation, refers to the regulations that require a company to have a documented training program for employees and contractors related to the company's management and protection programs. Training programs are expected to include program-specific policies, emergency preparedness, environmental response and information on the potential consequences of not responding appropriately. Training must also evaluate the competency to ensure knowledge requirements have been met.

Based on documents and records reviewed, the audit determined that TransCanada has developed effective methods to manage the training and qualification of its employees and contractors.

Management System Audit Sub-Element Finding: Based on documents reviewed and interviews with personnel, TransCanada was able to demonstrate that it was in compliance with the requirements of the OPR-99 and CSA Z662-11, and is therefore compliant with the requirements of this audit sub-element.

Operational Control – Normal Operations

The Management System Audit Sub-Element 3.6, Operational Control – Normal Operations, refers to the regulations that require a company to establish and maintain a process to develop, implement and communicate measures meant to mitigate, prevent and protect against the hazards identified in sub-sections 2.0 and 3.0. This includes measures to proactively reduce or eliminate risks and hazards at their source.

The audit determined that TransCanada's threat management programs provide a listing of appropriate integrity measures for managing identified risks and threats. Some of these threats include but are not limited to: pipeline corrosion; construction and manufacturing; weather and outside forces; and mechanical damage.

Management System Audit Sub-Element Finding: Based on documents reviewed and interviews with personnel, TransCanada was able to demonstrate that it was in compliance with the requirements of the OPR-99 and CSA Z662-11, and is therefore compliant with the requirements of this audit sub-element.

Operational Control – Upset or Abnormal Operating Conditions

The Management System Audit Sub-Element 3.7, Operational Control – Upset or Abnormal Operating Conditions, refers to the regulations that require a company to establish and maintain procedures to identify potential upset or abnormal operating conditions, accidental releases, incidents and emergency situations.

TransCanada has implemented a number of processes and procedures to identify potential upset or abnormal operating conditions. TransCanada's pipeline infrastructure is monitored remotely 24 hours a day, 365 days a year using a Supervisory Control and Data Acquisition (SCADA) system and is backed up by an onsite standby system. In the event that both of these systems fail due to a catastrophic event, a secondary control centre at a different location contains full duplicate primary and secondary back-up systems.

This audit also determined that TransCanada's pressure-limiting and relieving systems, leak detection, gas quality, alarm call-out, shutdown devices and valve operation systems were all adequate and compliant with the OPR-99 and CSA-Z662-11 requirements.

While over-pressure protection for TransCanada's oil pipeline systems was found to be adequate, the Board has determined the NOVA Gas Transmission Ltd (NGTL) system is not conducting sufficient inspections or audits of its customer installations to ensure that the system is operated in compliance with the OPR-99 and CSA-Z662-11 requirements. Based on that system's history of over-pressure incidents and the fact that TransCanada has not fully implemented its plan of action to verify compliance with requirements, the company is not in compliance with the OPR-99 and CSA-Z662-11 requirements and is therefore not in compliance with this audit sub-element.

Management System Audit Sub-Element Finding: Based on the documents assessed and interviews with personnel for programs related to over-pressure protection systems on the Alberta (NGTL) System, TransCanada is assessed to be non-compliant with the requirements of the OPR-99 and CSA Z662-11, and is therefore non-compliant with this audit sub-element.

Inspection, Measurement and Monitoring

The Management System Audit Sub-Element 4.1, Inspection, Measurement and Monitoring, refers to the regulations that require a company to develop and implement surveillance and monitoring programs including contract work being performed on behalf of the company. These programs are expected to include measures for evaluating a company's management and protection programs.

Based on documents and records reviewed, the audit determined that TransCanada has developed and implemented a number of effective inspection, measurement and monitoring programs.

Other sections of this sub-element were identified as non-complaint with regulatory requirements due to inadequate or incomplete program implementation. This included:

- TransCanada's position that ongoing monitoring of all shipped commodities for sour crude on the Keystone pipeline is not required since recent testing confirmed the current non-sour nature of these products;
- TransCanada's inability to produce sufficient evidence proving the adequacy of its ongoing integrity management programs for corrosion on unpiggable sections of the NGTL system; and
- background descriptions for the facility pipe inspection program that were too generic and did not provide the level of specificity required for adequate, effective and consistent implementation.

Management System Audit Element Finding: Based on the documents assessed and interviews with personnel as it relates to: monitoring of Hydrogen Sulfide (H_2S) in crude oil in the Keystone Pipeline; monitoring of external corrosion on the Alberta (NGTL) System's unpiggable pipelines; and the integrity monitoring of below-ground station piping on all of TransCanada's facilities, TransCanada is assessed to be non-compliant with the requirements of the OPR-99 and CSA Z662-11, and is therefore non-compliant with this audit sub-element.

Corrective and Preventive Actions

The Management System Audit Sub-Element 4.2, Corrective and Preventive Actions, refers to the regulations that require a company to have a process to investigate incidents or any non-compliance that may occur, including a process to mitigate any potential or actual impacts arising from the non-compliances. The company is also required to develop procedures to analyze incident data in order to identify deficiencies and opportunities for proactive improvement.

During the course of this audit, TransCanada provided evidence of its analysis of possible incident types. The company also demonstrated it had compiled and analyzed key performance indicator data in order to assess trends and establish root causes of incidents.

When issues or incidents are identified, the Board noted that TransCanada's internal non-compliance and incident reporting processes were adequate but could be more detailed in the areas of preventative action and information sharing across the company. TransCanada has committed to improving the level of detail in these items.

Management System Audit Sub-Element Finding: Based on documents reviewed and interviews with personnel, TransCanada was able to demonstrate that it was in compliance with the requirements of the OPR-99 and CSA Z662-11, and is therefore compliant with the requirements of this audit sub-element.

Internal Audit

The Management System Audit Sub-Element 4.4, Internal Audit, refers to the regulations that require a company to develop and implement a documented process for auditing its management and protection programs and procedures. The audit process is expected to include and manage training and competency requirements for staff carrying out the audits and be conducted on a regular basis.

Internal audits of TransCanada's IMPs are conducted by personnel that are independent of the areas to be audited or by a contracted third party. Quarterly field-based compliance audits are conducted at multiple locations across Canada. All audit findings are tracked and are required to be resolved. Findings are also categorized as either site-specific or systemic and responsibility for these is assigned accordingly. The progress of resolving audit findings is monitored and escalated where necessary.

Management System Audit Sub-Element Finding: Based on documents reviewed and interviews with personnel, TransCanada was able to demonstrate that it was in compliance with the requirements of the OPR-99 and CSA Z662-11, and is therefore compliant with the requirements of this audit sub-element.

Management Review

The Management System Audit Sub-Element 5.1, Management Review, refers to the regulations that require a company to formally review its management and protection programs for continuing suitability, adequacy and effectiveness. Reviews are expected to be based on appropriate documentation and records, be formal and documented, and occur on a regular basis.

The audit concluded TransCanada has undertaken several initiatives aimed at reviewing its IMPs. These include:

- Designating an executive to be accountable for management review;
- Having appropriate levels of responsibility and accountability at each level of the organization; and
- Participation in industry associations in order to share learnings and best practices.

Some of the non-compliances identified during the audit, such as insufficient overpressure protection and management of hazards associated with external corrosion, illustrate the results of a management review process that was not entirely effective. This element of the audit also included a review of the allegations presented by the complainant along with the corroborating internal review by TransCanada resulting from that complaint (see section below, Allegations of Non-Compliance).

Management System Audit Element Finding: Based on the documents assessed and interviews with personnel as related to Management Review, TransCanada is assessed to be non-compliant with the requirements of the OPR-99 and CSA Z662-11, and is therefore non-compliant with this audit sub-element.

Allegations of Non-Compliance

On 1 May 2012, the Board received a submission from a complainant outlining allegations of regulatory non-compliance against TransCanada's integrity management practices. These concerns were brought to the Board's attention after the complainant had voiced similar concerns through TransCanada's internal mechanisms.

The Board had previously scheduled an audit of TransCanada's Integrity Management Programs to start in the second quarter of 2013. As a result of allegations of regulatory non-compliance brought to the Board by a then employee of TransCanada (complainant), the Board advanced the timing of its audit and integrated an assessment of the allegations within the scope and technical protocols developed for the audit.

The Board's IMP audit conducted a detailed assessment of TransCanada's procedures as well as records of any corrective and preventative actions taken by TransCanada to address the allegations. Details of the Board's verification for each complainant allegation are contained in the audit sub-element 4.4, Internal Audit, in Appendix II of this Audit Report. The Board's audit has confirmed that the company has developed and implemented actions to correct and prevent similar occurrences for those issues confirmed to be valid. The Board's audit also identified that some of the complainant's allegations did not reflect issues of non-compliance with the regulatory requirements.

The Board assessed relevant company procedures along with records of any corrective and preventative actions taken to address the allegations. The Board also assessed TransCanada's internal investigation relating to its compliance with technical standards and procedures and notes that many of the allegations of regulatory non-compliance identified by the complainant were confirmed by TransCanada's internal audit.

The Board's audit has confirmed that as of the close of this audit, TransCanada has developed and implemented actions to correct and prevent similar occurrences for confirmed non-compliances identified by the complainant.

The Board finds that TransCanada's practices and procedures to deal with reporting of employee concerns at the time of the audit were not effectively implemented, supporting the Board's Non-Compliant finding with the audit sub-element 5.1 Management Review.

A detailed listing of the Board's assessment of each allegation has been documented in Appendix II, 4.4 Internal Audit.

Management System Audit Sub-Element Finding: See Finding for audit sub-element 4.4 – Internal Audit above.

7.0 Conclusions

NEB-regulated companies must demonstrate a proactive commitment to continual improvement in safety, security, and environmental protection. Pipeline companies under the Board's regulation are required to incorporate integrity management programs into their day-to-day operations. These programs include the tools, technologies and actions needed to ensure that pipelines are safe and remain that way over time. Integrity management programs enable pipeline companies to predict and prevent failures.

The Board has determined that TransCanada is compliant in five sub-elements of this audit including:

3.1 Organizational Structure, Roles and Responsibilities;
3.3 Training, Competence and Evaluation;
3.6 Operational Control-Normal Operations;
4.0 Corrective and Preventive Actions; and
4.4 Internal Audit.

The Board has determined that TransCanada is non-compliant in four sub-elements of the audit including:

2.1 Hazard Identification, Risk Assessment and Control;
3.7 Operational Control-Upset or Abnormal Operating Conditions;
4.1 Inspection, Measurement and Monitoring; and
5.1 Management Review.

The Board is of the view that the processes presently used by TransCanada have identified the majority, and most significant, of its hazards and risks. Notwithstanding this, the audit identified that the non-compliant findings are related to the following contributing factors:

- recognition of all potential hazards and integrating them into the program sub-elements that have been found to be non-compliant, and

- issues related to TransCanada's internal management practices. Examples of these include: over-reliance on lagging indicators; inadequate consideration of NEB safety advisories notifying where hazardous conditions existed and regulatory requirements were not being met; and ineffective implementation of internal practices to address the complainant's issues prior to Board notification.

With respect to the Board's investigation of the complainant's allegations of regulatory non-compliance against TransCanada integrity management practices, the Board's assessment has confirmed that TransCanada has now developed and implemented actions to correct and prevent similar occurrences for the confirmed issues. The NEB recognizes that even with a solid regulatory framework, it cannot be everywhere at every moment. That is why the Board encourages concerned individuals to voice their safety concerns with companies internally and, when necessary, to bring them to the attention of the Board.

The Board is also investigating certain steel pipe and fittings installed on the Keystone Pipeline with the potential to exhibit lower than specified yield strength. This investigation remains ongoing. Resolution of the investigation and any required remedial actions will be determined outside the audit.

An effective and well-implemented Integrity Management Program is only part of the overall requirement for NEB-regulated companies. As of the time this audit report is released, separate and concurrent audits of TransCanada's Safety, Environmental Protection, Emergency Management, Crossings and Public Awareness programs remain ongoing. The Board will make this Final Audit Report public and it will be posted on the Board's website.

TransCanada will be required to submit a CAP for Board approval within 30 days of the Final Audit Report being issued, detailing how the company will address findings of non-compliance identified in this audit. The Board will conduct further compliance verification activities to confirm that the improvements outlined in the CAP are being proactively implemented in an expedient manner and on a system-wide basis.

APPENDIX I

TRANSCANADA PIPELINES LIMITED AND NEB-REGULATED SUBSIDIARIES (TRANSCANADA)

MAPS AND SYSTEM DESCRIPTIONS

The following maps and descriptions are of TransCanada subsidiaries that were included in the scope of this audit, specifically:

- TransCanada PipeLines Limited;
- TransCanada Keystone Pipeline GP Ltd.;
- Trans Québec & Maritimes Pipeline Inc.;
- Foothills Pipe Lines Ltd.; and
- NOVA Gas Transmission Ltd.

These subsidiaries hold the certificates for TransCanada's NEB-regulated facilities, which include the Canadian Mainline, Keystone Pipeline, TQM Pipeline System, Foothills System, and the Alberta (NGTL) System.

The Canadian Mainline, shown in Figure 1, is a 14,100 km natural gas pipeline that extends from the Alberta/Saskatchewan border east to the Quebec/Vermont border and connects with other natural gas pipelines in Canada and the United States.

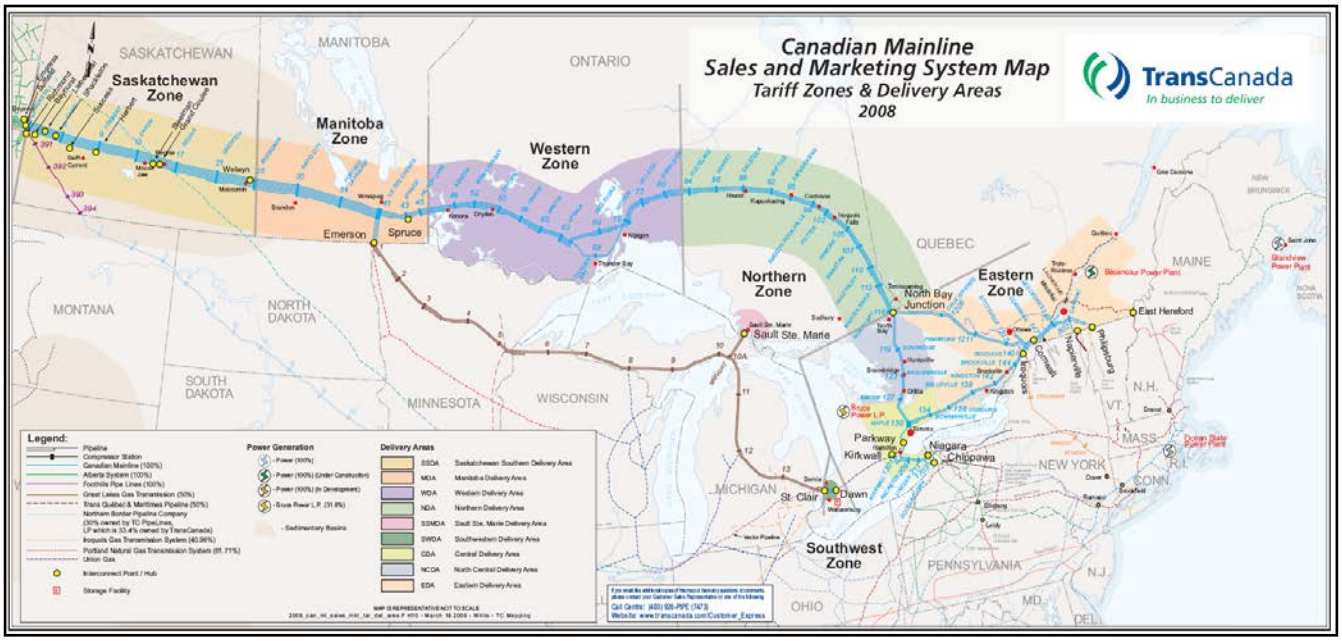

Figure 1: Canadian Mainline

The Keystone Pipeline, shown in Figure 2, is a 1,251 km pipeline that transports crude oil from Hardisty, Alberta to the Manitoba/North Dakota border. The Keystone Pipeline continues into the United States.

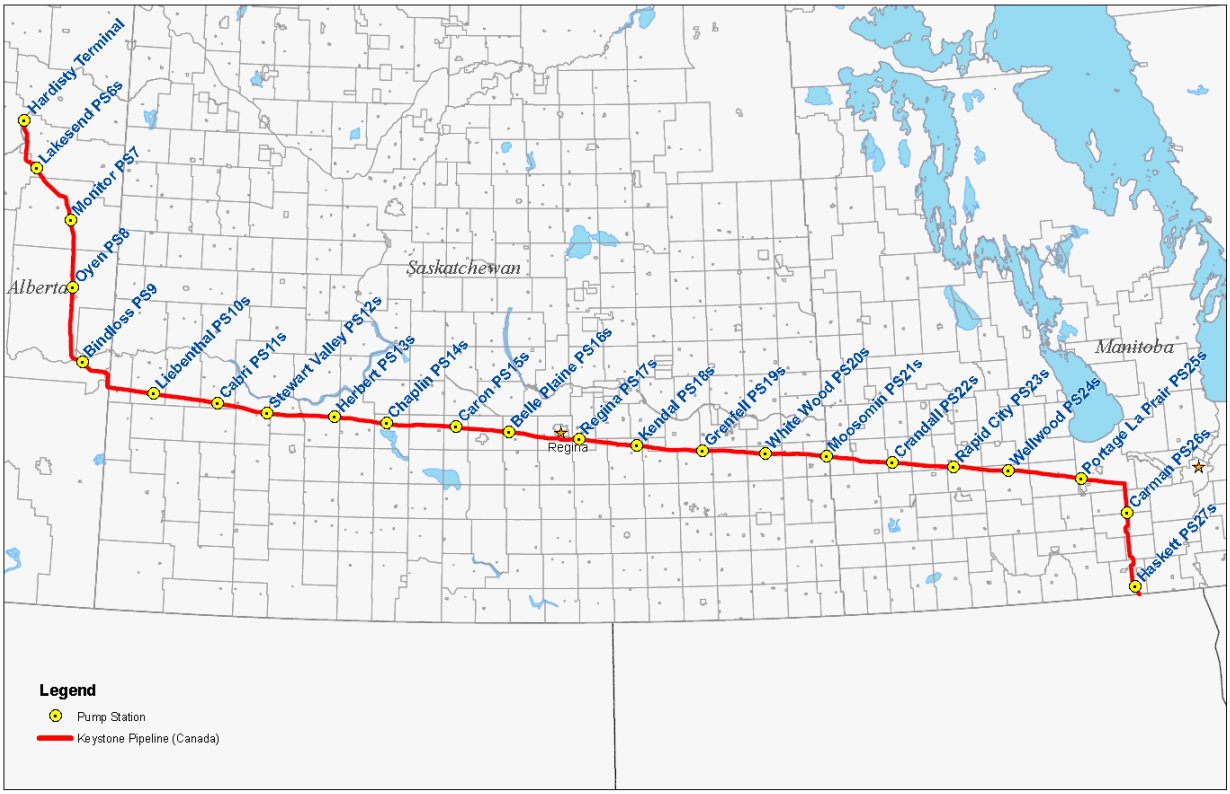

Figure 2: Keystone Pipeline

The TQM Pipeline System, shown in Figure 3, is a 573 km natural gas pipeline network in the Province of Quebec between Saint-Lazare, located west of Montreal, and Saint-Nicolas, located on the South Shore of Quebec City, and between Lachenaie, located East of Montreal, and East Hereford on the New Hampshire border.

Figure 3: TQM Pipeline System

The Foothills System, shown in Figure 4, is a 1,046 km natural gas pipeline system which carries natural gas from central Alberta to the United States.

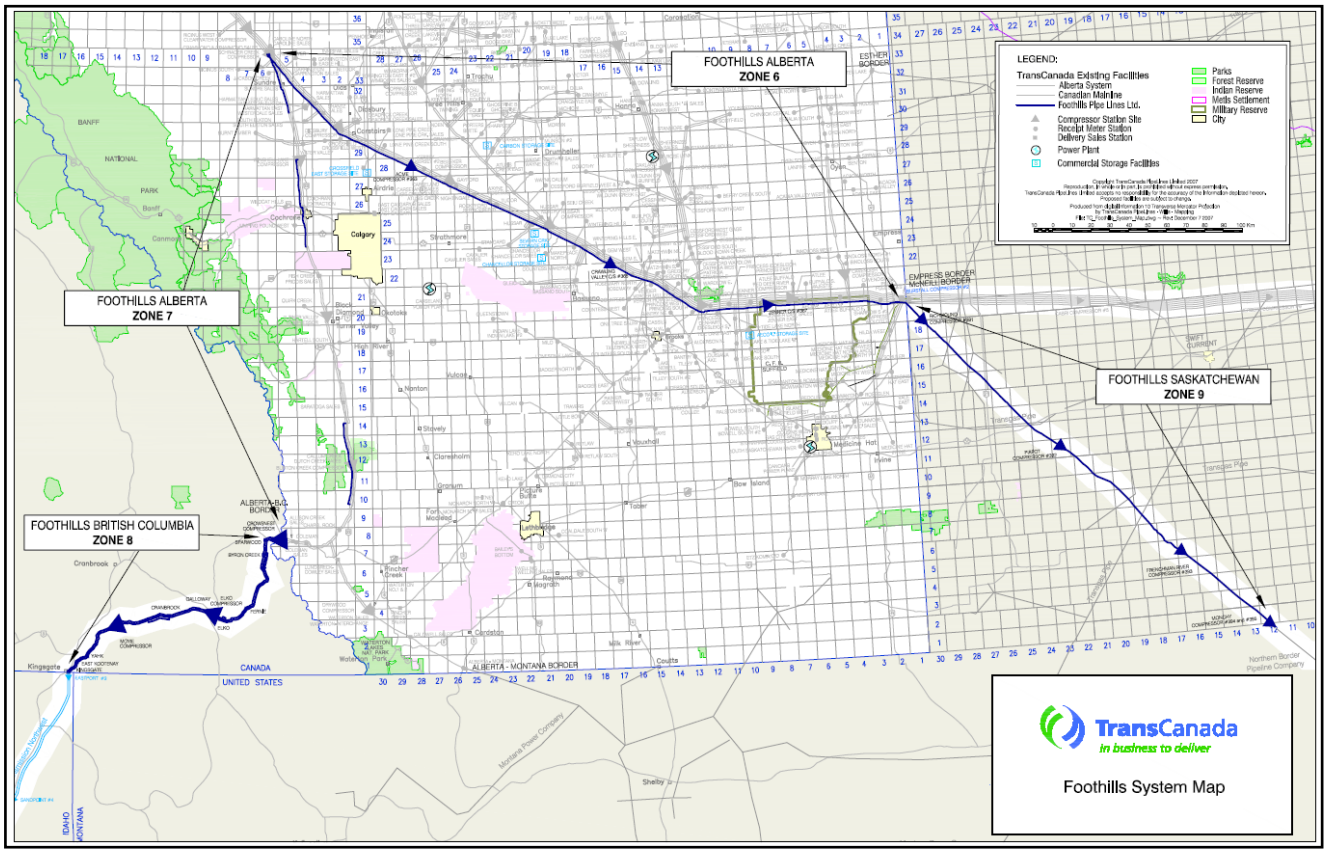

Figure 4: Foothills System

The Alberta (NGTL) System, shown in Figure 5, is a 24,828 km pipeline which gathers natural gas for use within the Province of Alberta, and which delivers natural gas to connection points with the Canadian Mainline, Foothills System, and the natural gas pipelines of other companies.

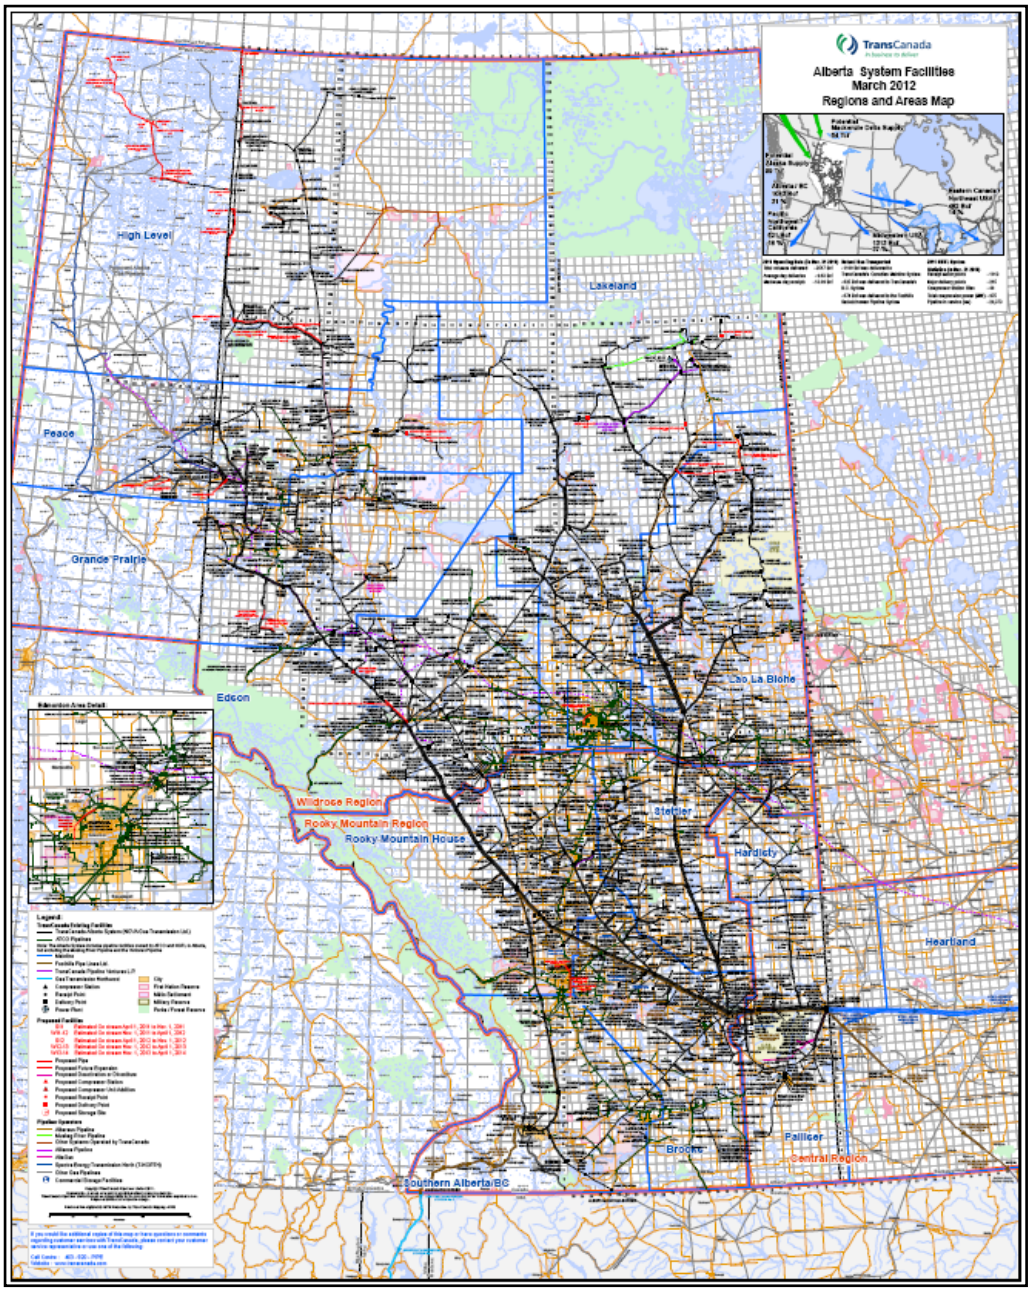

Figure 5: Alberta (NGTL) System

APPENDIX II

TRANSCANADA PIPELINES LIMITED AND NEB-REGULATED SUBSIDIARIES (TRANSCANADA)
INTEGRITY MANAGEMENT PROGRAM AUDIT ASSESSMENT

INTRODUCTION:

TransCanada has three Integrity Management Programs (IMPs), which are:

- Canadian Gas Pipeline Integrity Management Program (CND-GAS-IMP);
- Canadian Liquid Integrity Management Program (CDN-LIQ-IMP); and
- Plant Integrity Management Program (Plant IMP).

These IMPs are referred to throughout this Audit Evaluation Table as the Gas Pipeline IMP, Liquid Pipeline IMP, and Plant IMP, respectively.

The TransCanada subsidiaries included in this audit included specifically:

- TransCanada PipeLines Limited;
- TransCanada Keystone Pipeline GP Ltd.;
- Trans Québec & Maritimes Pipeline Inc.;
- Foothills Pipe Lines Ltd.; and
- NOVA Gas Transmission Ltd.

AUDIT OBJECTIVES AND SCOPE:

The scope of the audit included an assessment of whether TransCanada was fulfilling the requirements of:

- the NEB Act;
- the OPR-99;
- *CSA Z662-11, Oil and Gas Pipeline Systems*; and
- TransCanada's policies, practices and procedures.

More specifically, the audit examined nine sub-elements of the NEB management system requirements as they relate to TransCanada's integrity management programs. These sub-elements were selected using the Board's risk-informed approach to focus the scope of the audit on areas that have previously been shown to have the highest rates of non-compliance among

NEB-regulated companies and to expedite and focus the assessment of the IMP technical programs in light of the allegations.

1.0 POLICY AND COMMITMENT

1.1 Policy and Commitment Statements

Expectations: The Company shall have a policy approved and endorsed by senior management (the Policy). It should include goals and objectives and commit to improving the performance of the Company.

References:

OPR-99 section 4
CSA Z662-11, Clauses 3.1.2 and 3.2

Audit Assessment:

This Management System sub-element was not formally assessed during the Integrity Management Program audit.

Compliance Status: Not Assessed

2.0 PLANNING

2.1 Hazard Identification, Risk Assessment and Control[1]

Expectations: The company shall be able to demonstrate a procedure to identify all possible hazards. The company shall assess the degree of risk associated with these hazards. The company should be able to support the rationale for including or excluding possible risks in regard to its environment, safety, integrity, crossings and awareness and emergency management and protection programs (management and protection programs). The company shall be able to implement control measures to minimize or eliminate the risk.

References:

OPR-99 sections 4 (2), 39, 40 and 41
CSA Z662-11, Clauses 3.1.2(f), 3.2(a), 3.2(b), 10.5.1.1(d) and 16.2

Audit Assessment:

General

During interviews and in documents submitted, TransCanada stated that it has developed procedures to identify threats (hazards), assess the degree of risk associated with those threats, and implement control measures to mitigate or eliminate the risk of the threats. TransCanada explained that its Engineering and Asset Reliability (E&AR) department is accountable for managing the operational performance, cost and risks of TransCanada's pipeline and facility assets. This includes developing and implementing asset strategies and integrity management systems to manage operating and maintenance risk. Within the E&AR department, subject matter experts in the Pipe Integrity and Facilities Integrity departments are responsible for developing Integrity Management Programs (IMPs). Pipe Integrity is grouped into threat-specific teams, and Facilities Integrity is grouped into equipment-specific teams. These teams are accountable for assessing risks and developing annual maintenance and assessment work plans.

Hazard Identification Process

[1] Hazard: Source or situation with a potential for harm in terms of injury of ill health, damage to property, damage to workplace environment, or a combination of these. Risk: Combination of the likelihood and consequence(s) of a specified hazardous event occurring.

Processes for threat[2] identification and risk assessment and control are documented in TransCanada's three IMPs, which are:

- Canadian Gas Pipeline Integrity Management Program (CND-GAS-IMP);
- Canadian Liquid Integrity Management Program (CDN-LIQ-IMP); and
- Plant Integrity Management Program (Plant IMP).

Threat Identification Process

TransCanada's threat identification process is meant to verify conditions that may exist that would make a line segment susceptible to a threat. The determination of these conditions varies with each threat category. TransCanada considers threats according to the following:

- Time Dependent
  - External corrosion
  - Internal corrosion
  - Environmental cracking (e.g. stress corrosion cracking)
- Time Independent
  - Mechanical damage
  - Incorrect operations
  - Weather-related and outside forces
- Static or Resident
  - Manufacturing related defects
  - Welding or fabrication related defects
  - Equipment failures

TransCanada's process for threat identification was reviewed for all threats and, except where noted for the threat to high pressure station piping in gas facilities, was assessed to be compliant with the requirements. An example of one of the threat assessments for mechanical damage (dents) is provided to illustrate TransCanada's process.

Individual Threat Assessments: Mechanical Damage (Dents)

TransCanada's dent program is managed according to TEP-ILI-DEF-CDN Analysis of Deformation In-Line Inspection (ILI) Data for CDN Pipelines (EDMS No. 006980190) and TEP-ITM-Mechanical Damage Threat Management Program (TEP-ITM-MECH, EDMS No. 006786487). TransCanada uses data from the ILI program to characterize dents in its pipeline system and TransCanada continues to develop this technology with the tool vendors. The

[2] TransCanada uses the term "threat" for "hazard" in its documents.

detection and characterization of geometric anomalies undergoes further processing to develop prioritized remediation activities in specific areas, based on previous excavation reports from other programs and in areas where dents have been previously mitigated. When dents are excavated, TransCanada applies the methodologies of CSA Z662-11, ASME B31.8 and its own modified B31.8 formula to determine which remediation or mitigation techniques may be applied. TransCanada considers the threat of mechanical damage from external sources as low, due to its Public Awareness Program and the Right of Way (ROW) patrols that it conducts. Additional measures are applied to areas determined to have a threat of mechanical damage that is higher than low (e.g., population density, history of damage, increased construction activity).

Pipelines

For pipelines, TransCanada has detailed nine potential threat categories that are considered during its threat identification process (Gas Pipeline IMP, Section 9.7, and Liquid Pipeline IMP, Section 3.1.2). The threat categories also include sub-threats derived from consideration of CSA Z662-11, Annex H, Clause H.2.6 and ASME B31.8S.

TransCanada's Threat Management Programs for the nine threat categories referred to above are as follows:

- Mechanical Damage Threat Management Program (TEP-ITM-MECH, EDMS No. 006786487);
- External Corrosion Threat Management Program (CDN) (TEP-ITM-ECOR, EDMS No. 006570955);
- Internal Corrosion Threat Management Program (TEP-ITM-IC, EDMS No. 006786402);
- Stress Corrosion Cracking Threat Management Program (TEP-ITM-SCC-CDN, EDMS No. 005767613);
- Equipment Failure Threat Management Program (TEP-ITM-EQUIP, EDMS No. 006786449);
- Incorrect Operations Threat Management Program (TEP-ITM-IOPS, EDMS No. 006810297);
- Construction and Manufacturing Threat Management Program (TEP-ITM-MANUF, EDMS No. 006786458);
- Weather and Outside Forces Threat Management Program (TEP-ITM-WOF, EDMS No. 005767611); and
- Facility Pipe Threat Management Program (CDN) (TEP-ITM-FPIPE-CDN, EDMS No. 007379193).

Section 9 of the Gas Pipeline IMP specifies how each threat management program has a consistent approach whereby threat identification is one step in an overall threat management process. Pipe segments susceptible to a threat are identified and the rationale for including or excluding threats is documented within each threat management program. Risk analyses are completed and the results of the analyses are used to prioritize and plan activities to reduce or eliminate the probability of failure, the consequences of failure, or both. Selected activities for the upcoming budget cycle are captured annually in TransCanada's Pipeline Maintenance Plan. Results obtained from the execution of the Pipeline Maintenance Plan are assessed and used as additional inputs into the next planning cycle.

Facilities

The TransCanada Facility Group is divided into several areas of expertise, which include Mechanical, Field SCADA, Civil Engineering, Design Engineering Support, Measurement Engineering, Controls, and Electrical. As per Section 2.5.5 of the Plant IMP, new construction is completed in compliance with the applicable codes, which address the associated hazards and corresponding risks. In addition, many of the potential operating hazards are identified and mitigated during the early design stage through Hazard Identification Studies (HAZID) and Hazard and Operability Studies (HAZOP) analyses. With the Project Turnover Memorandum, residual risks are identified and documented for the facility integrity group. To address ongoing reliability, applicable existing plans are used, or new integrity plans are created, to maintain the equipment functionality so that the identified hazards, associated designs and codes are managed throughout the lifecycle of the equipment.

High Pressure Station Piping in Gas Facilities

TransCanada developed a new management program in December 2012 for high pressure piping in gas facilities (e.g., meter and compressor stations, valves sites). This is documented in the Facility Pipe Threat Management Program (TEP-ITM-FPIPE-CDN, EDMS No. 007379193). Before this new program was developed, the station piping was managed under TransCanada's *Integrity Management Process for Pipelines - Revision 2* process. The new program includes a documented process for identifying the hazard and assessing the risk of high pressure station piping. The new program was assessed as adequate in terms of its content, but it has not yet been fully implemented throughout TransCanada's facilities. TransCanada indicated in its response to an Audit Information Request that "*the risk assessment and selection of mitigation plans is planned for completion in November of 2013*". Given that the new program has not yet been fully implemented, TransCanada is non-compliant with the requirements of this audit sub-element and with CSA Z662-11, Clauses 3.1.2(f) and 3.2.

Risk Assessment

TransCanada has implemented its Asset Management System (AMS) to manage its operating and maintenance risk. The risk management element of the AMS outlines a requirement for Operations and Engineering to develop and maintain a risk register to capture risk events for all assets that TransCanada operates. The Asset Management System & Governance (AMS&G) team oversees the development of the register, but inputs are collected from engineering, field operations, commercial operations, corporate health and safety, and compliance departments. Risks are calculated by aligning the probability of events and the potential magnitude of consequences. The risk register is currently entered and maintained within a Microsoft Access database and is controlled by the AMS&G team during its developmental stages to maintain integrity of the data. An assessment of the establishment and implementation of the risk assessment processes follows, based on facility categorizations.

Pipelines

Risk Assessment and Management methodologies are documented in Section 10 of the Gas Pipeline IMP and Section 4 of the Liquid Pipeline IMP. As noted previously under Threat Identification, the processes used to assess risk are threat-specific, and process details are provided in the Risk Assessment and Prioritization of TransCanada's Integrity Threat Management Programs.

TransCanada's risk assessment and risk management are achieved using either of the following two approaches:

1. For pipelines where assessment or direct examination anomalies have been detected, or similar conditions are inferred, the specific anomalies are assessed, and control or mitigation activities are planned.

2. For pipelines where assessment data has not been collected, risk assessment is performed by integrating information from various sources, including: subject matter expertise; applied learnings from other similar segments of pipe across the TransCanada system, including historical performance; the TransCanada risk algorithm Risk Assessment Using PRIME (TEP-INT-PRIME, EDMS No. 003972569), for External Corrosion and SCC threat; and, the tracking of leading indicators, such as an elevation in communication to stakeholders in response to a spike in the frequency of unauthorized encroachments on the ROW or relevant information from industry associations.

Where assessment data is available, a pre-screening is performed to look for urgent repair conditions. This is followed by a reliability based assessment to evaluate the probability of

failure and account for measurement uncertainties. The technical details of the model are included in the document Risk Models for Corrosion Using ILI Data (TER-COR-RSK, EDMS No. 005767603). With the assessment data, near-term and future remediation is planned, and priority is assigned according to population density. Additionally, ongoing safety is addressed through a temporary pressure restriction. The criteria for determining when a pressure restriction is required are outlined in Analysis of MFL In-Line Inspection for CDN Pipelines (CDN) (TEP-INT-ILI-CDN EDMS No. 006570876). The procedure for implementing the pressure restriction is outlined in the TOP Pipeline Restriction Procedure. Pressure control is addressed per the System Design & Commercial Operations Pipeline MAOP De-rate Procedure (EDMS No. 006837355).

When assessment data has not been collected, a risk assessment is performed by executing the TransCanada risk algorithm Risk Assessment Using PRIME (TEP-INT-PRIME, EDMS No. 003972569). Subject matter experts integrate the PRIME data results with other relevant information to prioritize the pipeline inspection schedules.

An example of risk assessment and management is provided for the Weather and Outside Forces (WOF) threat. This threat is managed according to the Weather and Outside Forces Threat Management Program (TEP-ITM-WOF, EDMS No. 005767611). The approach is to conduct a Phase 1 geotechnical study along all of the company pipeline assets. Areas of elevated concern are identified and then reviewed further with Phase 2 and Phase 3 studies. The collected information is used to determine the actual risk to the pipeline asset, and then mitigation, control or monitoring programs are planned, based on the results. TransCanada's risk assessment and risk management process for the threat of WOF was assessed to be adequate.

Facilities

Integrity management of facilities at TransCanada comprises four risk-assessed components:

1. Integrity Planning, including System Assessment, Facilities Assessment, and Integrity Programs;
2. Project Integrity, including Project Risk Analysis, Business Value Analysis, and Project Ranking;
3. Design Integrity, including Inter Disciplinary Design Check Meetings, and Reliability and Maintainability; and
4. Maintenance Integrity, including Facility Criticality.

In managing the integrity of non-pipe facilities, TransCanada identified a number of potential integrity threats, including equipment failure, inability to operate as expected, obsolescence, and

environmental and safety concerns. Consequences of facility threats and potential failures include public safety impact, loss of life, customer/business impact, regulatory impact, and environmental impact. Risk assessments are performed on the potential threats and consequences to identify potential impacts as well as corrective and preventive actions. When activities are required to manage the risk, the details on conducting these activities are then documented in TransCanada's equipment-specific integrity plans. Each equipment-specific integrity plan is developed with input from the regions, equipment manufacturers, Issue and Incident Tracking (IIT), other operators, Pipeline System Operations, and the previous year's integrity plans. The equipment-specific integrity plans reference the relevant TransCanada Operating Procedures (TOPs) that were developed to manage threats and mitigate risks to the reliable operation of facility equipment.

Specific equipment integrity plans that address the risk requirements have been written for many equipment types. Examples are provided in the following documents:

- The Mainline Field SCADA Engineering Integrity Plan (EDMS No. 004782175) contains a section on Risk Assessment (Section 4), and identifies issues of concern, the resulting impact, and an action plan to address the issue. Additionally, Section 3 of the document contains the operating and maintenance strategy that includes planned, predictive and reactive maintenance.
- The Pressure Vessels Integrity Plan (EDMS No. 003763099) contains a section on Risk Assessment (Section 4). Pressure vessel inspection is addressed and reference is made to the TOP Pressure Vessel External and Internal Inspection (EDMS No. 003694710).

Recent Threat Identification or Risk Assessments

Threat identification and risk assessment activities are aggregated annually as part of the pipeline and facilities maintenance program budget approval process. The Pipeline and Facilities Maintenance Programs (PMP) for 2013, which are the output of the aggregated threat identification risk assessment, were finalized in September 2012.

Records indicated that for pipelines and facilities, work is planned and risk assessments are conducted with consideration given to the consequences of safety, health, the environment and individual risk. Consequences are considered during prioritization of remediation, prevention, control and mitigation activities, and also in repair criteria.

For gas pipelines, mitigation and repair activities requiring excavation of pipeline assets are conducted under the TOP Excavation Procedure (EDMS No. 003672343). The procedure references consultation with a TransCanada Environmental Specialist, and requires all work to

be performed in compliance with the Environmental Field Procedures Guide (EDMS No. 003671954).

For liquid pipelines, risk assessments take into consideration the consequences of a potential release. For example, potential consequences that are considered are oil releases into what TransCanada refers to as “highly sensitive receptors”. These are defined by TransCanada as specific areas where a release from a pipeline could have significant consequences on public health, the environment or the economy.

For the risk associated with third party damage, TransCanada has pipeline class location and urban development programs to evaluate the issue relating to protecting the public and the pipeline as population growth encroaches on pipelines (Pipeline Crossing and Encroachment Procedure Canada TOP, (EDMS No. 003674617), Pipeline Right-Of-Way Procedures Canada TOP (EDMS No. 003672613), and TEP-INT-CLA Class Analysis and Remediation (CDN) (EDMS No. 005766974). TransCanada stated that its Public Awareness Program (TOP Pipeline Public Awareness Program Plan, EDMS No. 003860909) educates and increases awareness of pipeline safety.

Upon completion of a threat identification and risk assessment, the individual threat teams develop a threat-specific Pipeline Maintenance Plan (PMP). Asset-based program planners assemble the threat specific sections of the PMP into a single, asset specific, PMP. During audit interviews and through documents reviewed, the Board confirmed that threat identification for the liquid pipeline has been performed primarily by the liquid integrity team, with adequate support from the threat-specific subject matter experts as required.

Risk control measures are identified through several avenues, including the following:

- The remediation and mitigation measures required to address specific defects are identified in the Threat Management Programs.
- The Corrosion Prevention team is accountable for corrosion control through inspection, maintenance and remediation of the cathodic protection system.
- TransCanada Operating Procedures (TOPs) are built, where applicable, to manage a particular threat or risk (e.g., the TOP Keystone Pressure Control Valve Vibration Evaluation Procedure (EDMS No. 006811833)).
- TOPs are also developed to ensure that routine, consistent inspection and maintenance is performed (e.g., the TOP Relief Valve Inspection and Overhaul Program (EDMS No. 003694631) and the TOP Valve and Valve Operator Inspection and Servicing (EDMS No. 003849601)).

Low Strength Steel Pipe and Fittings

In 2008, the NEB became aware that certain steel pipe and fittings procured and installed on the Keystone Pipeline had the potential to exhibit lower that specified yield strengths. The NEB subsequently initiated an investigation. This investigation preceded the audit and is ongoing. The low yield issue was confirmed during the audit, and documents were reviewed and interviews conducted with TransCanada personnel related to the issue. However, as the issue continues to be under investigation by the NEB, resolution of the investigation and any required remedial actions will be determined outside of the audit.

Summary: Hazard Identification, Risk Assessment and Control

The Management System Audit Element 2.1, Hazard Identification, Risk Assessment and Control, requires a company to have a procedure to identify all possible hazards, to assess the degree of risk associated with these hazards, and to implement control measures to minimize or eliminate the risk.

TransCanada has implemented a system to identify and manage its operating and maintenance risk. Risks are calculated by incorporating the probability of events and the potential magnitude of the consequences. Records indicate that for pipelines and facilities, work is planned and risk-assessments are conducted with consideration given to safety, health, and the environment. TransCanada's process for threat identification was reviewed for all threats and was assessed to be compliant with the requirements.

The audit identified only one area of non-compliance in the sub-element of hazard identification, risk assessment and gas control. TransCanada developed a new management program for high pressure piping in facilities. This new program has been assessed and is adequate in terms of its content, but has not yet been fully implemented throughout all of TransCanada's facilities.

Management System Audit Sub-Element Finding: Based on the incomplete implementation of the required high pressure station piping program for its gas facilities, TransCanada is assessed to be non-compliant with the requirements of the OPR-99 and CSA Z662-11, and is therefore non-compliant with this audit sub-element.

Compliance Status: Non-Compliant

2.2 Legal Requirements

Expectations: The Company shall have a verifiable process for the identification and integration of legal requirements into its management and protection programs. The Company should have a documented procedure to identify and resolve non-compliances as they relate to legal requirements which includes updating the management and protection programs as required.

References:

OPR-99 sections 4, 6, 40 and 41(1)
CSA Z662-11, Clause 3.2

Audit Assessment

This Management System sub-element was not formally assessed during the Integrity Management Program audit.

Compliance Status: Not Assessed

2.3 Goals, Objectives and Targets

Expectations: The Company shall have goals, objectives and quantifiable targets relevant to the risks and hazards associated with the Company's facilities and activities (i.e. construction, operations and maintenance). The objectives and targets should be measurable and consistent with the Policy and legal requirements and ideally include continual improvement and prevention initiatives, where appropriate.

OPR-99 section 40
CSA Z662-11, Clauses 3.1.2 (h) (ii) and 3.2

Audit Assessment

This Management System sub-element was not formally assessed during the Integrity Management Program audit.

Compliance Status: Not Assessed

3.0 IMPLEMENTATION

3.1 Organizational Structure, Roles and Responsibilities

Expectations: The company shall have an organizational structure that allows its management and protection programs to effectively function. The company shall have clear roles and responsibilities, which may include responsibilities for the implementation of the management and protection programs.

References:

OPR-99 sections 40, 47 and 48
CSA Z662-11, Clauses 3.1.1, 3.1.2(b) and 3.2

Audit Assessment

General
During interviews and in documents submitted, TransCanada stated that it has an organizational structure that allows it's Integrity Management Programs (IMPs) to function effectively and efficiently across its gas and liquids pipelines and facilities assets.

TransCanada stated that the employees (primarily engineers and technologists) managing its Canadian IMPs are primarily based in Calgary. Approximately 160 staff performs work related to the Gas and Liquid Pipeline IMPs and approximately 150 staff performs work related to the Plant IMP. In addition, approximately 80 integrity specialists are located in regional offices across the Canadian pipeline system. These individuals are complemented by Field Technicians who execute integrity related activities.

The hierarchy of authority for the IMPs within TransCanada extends from an Executive Vice President, to Vice President, to Director, to Manager, to Program Lead/Manager levels. Under the Vice President of Engineering and Asset Reliability, one Director is responsible for pipe integrity and another Director is responsible for facilities (plant) integrity. The authorities and associated responsibilities are detailed in the respective IMP documents, specifically:

- Gas Pipeline IMP, Section 3 and Appendix A;
- Liquid Pipeline IMP, Section 2 and Appendix A; and
- Plant IMP, Section 2 and Appendix C.

The audit determined that, for the Gas and Liquid Pipeline IMPs, roles and responsibilities are defined and documented for the key positions. These two IMPs also describe the accountabilities and responsibilities of the relevant TransCanada organizational units, arranged by Threats. The roles and responsibilities for each organizational unit are further detailed in the TransCanada Engineering Procedures (TEPs) for each Threat, as follows:

- IMP Management Review: TEP-INT-MREV Pipe Integrity Management Review Process;
- External Corrosion: TEP-ITM-ECOR-CDN External Corrosion Threat Management Program;
- Internal Corrosion: TEP-ITM-IC Internal Corrosion Threat Management Program;
- Equipment Failure: TEP-ITM-EQUIP Equipment Failure Threat Management Program;
- Incorrect Operations: TEP-ITM-IOPS Incorrect Operations Threat Management Program;
- Manufacturing: TEP-ITM-MANUF-CDN Manufacturing, Fabrication and Construction Threat Management Program;
- Mechanical Damage: TEP-ITM-MECH Mechanical Damage Threat Management Program;
- Stress Corrosion Cracking: TEP-ITM-SCC-CDN Stress Corrosion Cracking Threat Management Program; and
- Geotechnical: TEP-ITM-WOF Weather and Outside Forces (Geotechnical) Threat Management Process.

Based on documentation reviewed and interviews with personnel, TransCanada's organizational structure, roles and responsibilities for the Gas and Liquid Pipeline IMPs are compliant with the requirements for this sub-element. The organizational structures relevant to these two IMPs are well defined, with adequate dedicated resources.

The audit determined that the roles and responsibilities for the Plant IMP are not as well defined. In Section 2.2 of the Plant IMP (Lines of Responsibility and Development of IMP/Risk Mitigation Process), only high level positions (e.g., Executive Vice President, Vice President, Director) are identified with respect to the Plant IMP. The functional key positions for the Plant IMP are not specified. The organizational chart in Appendix C of the Plant IMP is considerably less detailed than the organizational charts provided in Appendix A of both the Gas Pipeline IMP and the Liquid Pipeline IMP.

During the audit, TransCanada was in the process of revising its Plant IMP. The Facility Integrity and Reliability Management Program (FIRM) (EDMS No. 007803540) were approved by TransCanada management in July 2013. Section 2.2 (Roles and Responsibilities) of the FIRM

more explicitly details the functions and processes of the FIRM Program, departmental interactions and the organizational structure. The roles and responsibilities for pressure vessels, over-pressure protection, relief valves and tanks were referenced in the appropriate TEPs, TransCanada Engineering Specifications (TESs), TransCanada Operating Procedures (TOPs) and TransCanada Engineering Directives (TEDs). The FIRM references Section 6 of TransCanada's Quality Assurance Manual (QMS) (EDMS No. 003722000) that identifies the roles and responsibilities for pressure vessels, heating boilers and ASME pressure relief vessels across the organization. TransCanada's revised FIRM addresses the requirements of roles and responsibilities that were lacking in the Plant IMP.

In addition to the organizational structure related to TransCanada's IMPs, the audit assessed the roles and responsibilities of integrity personnel as they relate to construction projects. This information was required because the IMPs are under the main organizational structure of Operations and Engineering (O&E), while construction activities are under the main organizational structure of Major Projects. In light of this separate organizational structure, the audit assessed whether sharing of information on integrity related issues, incidents and learnings identified is occurring. Sharing of information related to issues identified during the operational life of pipelines and facilities (by the IMP personnel) is important because it could require changes to the design and/or construction of future pipelines and facilities (by the Major Projects personnel). Conversely, sharing of information related to issues identified during construction is important because it could have an impact on the subsequent IMPs for both pipelines and facilities.

During audit interviews, TransCanada explained how its Capital Projects Management System requires that functional engagement and support between O&E and Major Projects occur, and that the O&E Functional Engagement and Support document describes the engagement accountabilities for the Project Manager, Project Engineering Manager and the Integration Manager. The documents and records examined confirmed adequate communication between the O&E integrity personnel and Major Projects personnel.

Summary: Organizational Structure, Roles and Responsibilities

The Management System Audit Element 3.1, Organizational Structure, Roles and Responsibilities, requires a company to have an organizational structure that allows its management and protection programs to effectively function. It also requires companies to have clear roles and responsibilities, which may include responsibilities for the implementation of these programs.

TransCanada has approximately 310 employees performing work related to its integrity management programs across its Canadian pipeline system. This is complemented by approximately 80 field technicians who execute integrity-related activities.

The audit determined that for gas and liquid pipeline IMPs, roles and responsibilities are well-defined and have adequate, dedicated resources. The audit also assessed TransCanada's revised plant IMP, now known as the Facility, Integrity and Reliability Management Program (FIRM), and found that it addresses the roles and responsibilities that were lacking in the previous version.

Management System Audit Sub-Element Finding: Based on documents reviewed and interviews with personnel, TransCanada was able to demonstrate that it was in compliance with the requirements of the OPR-99 and CSA Z662-11, and is therefore compliant with the requirements of this audit sub-element.

Compliance Status: Compliant

3.2 Management of Change

Expectations: The Company shall have a management of change program. The program should include:

- identification of changes that could affect the management and protection programs;
- documentation of the changes; and
- analysis of implications and effects of the changes, including introduction of new risks or hazards or legal requirements.

References:

OPR-99 section 6
CSA Z662-11, Clause 3.1.2 (g)

Audit Assessment

This Management System sub-element was not formally assessed during the Integrity Management Program audit.

Compliance Status: Not Assessed

3.3 Training, Competence and Evaluation

Expectations: The company shall have a documented training program for employees and contractors related to the company's management and protection programs. The company shall inform visitors to company maintenance sites of the practices and procedures to be followed. Training requirements should include information about program-specific policies. Training should include emergency preparedness and environmental response requirements as well as the potential consequences of not following the requirements. The company shall determine the required levels of competency for employees and contractors. Training shall evaluate competency to ensure desired knowledge requirements have been met. Training programs should include record management procedures. The training program should include methods to ensure staff remains current in their required training. The program should include requirements and standards for addressing any identified non-compliances to the training requirement.

OPR-99 sections 4, 18, 29 and 46
CSA Z662-11, Clauses 3.1.2(c), 3.2 and 10.2.1

Audit Assessment:

General

During interviews and in documents submitted, TransCanada stated that it has a documented training program for employees and internal contractors related to its Integrity Management Programs (IMPs). TransCanada indicated that training requirements for external contractors are specified within its service contracts that are verified through inspections and supervision by TransCanada personnel.

TransCanada uses the following methods to manage the training and qualification of employees, and in some instances internal contractors:

- Learning Management System (LMS);
- Active Management;
- Practice of Engineering (POE); and
- Performance Management Process.

Learning Management System

The LMS is a web-based tool used to manage the training and competency evaluation for TransCanada employees and internal contractors. LMS is also used to document the results of technical tasks evaluated through three competency evaluation methods (Manager Review, Discuss and Describe, and Jobsite Observation), which are discussed below. Any worker who has not been deemed competent or qualified for a particular task is prohibited from independently performing that task.

Field Role Technical Competency

In 2011, TransCanada introduced its Field Role Task Evaluation Project to improve the quality of the learning, development and competency evaluation programs related to field-based work. The competency evaluation method and training requirements for field technical tasks utilizes a model developed by the Canadian Gas Association and has been adapted for TransCanada's use. For field role evaluations, interviews or jobsite task observations or simulations are required to demonstrate competency. TransCanada uses three methods of competency evaluation:

- Manager Review – Applies to low risk level task evaluations. Under this method of evaluation, the manager, in consultation with a Qualified Technician, will approve task competency of the employee.
- Discuss and Describe – Applies to medium risk level task evaluations. Under this method of evaluation, the manager will approve task competency of an employee based on a successful interview evaluation conducted by a qualified evaluator.
- Jobsite Observation – Applies to high risk level task evaluations. Under this method of evaluation, the manager will approve task competency of the employee based on successful jobsite task simulation or performance in the presence of a qualified evaluator.

Active Management

TransCanada's leadership is responsible for ensuring that its employees and internal contractors are properly trained and competent to perform their assigned tasks. Managers complete this by actively assigning and monitoring work, providing feedback and reviewing staff competency on an ongoing basis.

Practice of Engineering (POE)

TransCanada's POE specification, TES-ENG-POE (EDMS No. 003672108), defines the required professional member jurisdictional registration for engineering staff and defines scope of practice. APEGA (Association of Professional Engineers and Geoscientists of Alberta)

registration is a hiring requirement for engineering positions located in Alberta. The POE specifies qualifications for Engineer-in-Charge, Responsible Engineers and design discipline checkers. The Engineer-in-Charge is accountable for ensuring that personnel carrying out engineering work are qualified and competent to do so for the jurisdiction in which the engineering and construction are occurring.

Performance Management Process

During the audit interviews and document review, TransCanada stated that it monitors and manages employee development and training through its Performance Management Process (PMP), which is used to establish annual performance expectations and document the development and training plan of each employee. The PMP identifies employee development requirements, including training. Adjustments are made to an employee's development plan to meet evolving job requirements, as required. Performance management, specifically related to pipe integrity, is documented in TEP-INT-COMP Pipe Integrity Hiring, Training and Competency Evaluation Procedure (EDMS No. 007379172), that outlines the methodology used to identify and communicate training requirements and evaluation of competency. Records of training and competency, which were reviewed during the audit, are provided in Element 4.1 Inspection, Measurement and Monitoring, as they applied to TransCanada's programs.

Summary: Training, Competence and Evaluation

The Management System Audit Element 3.3, Training, Competence and Evaluation, requires a company to have a documented training program for employees and contractors related to the company's management and protection programs. Training program should include program-specific policies, emergency preparedness, environmental response and information on the potential consequences of not responding appropriately. Training must also evaluate the competency to ensure knowledge requirements have been met.

Based on documents and records reviewed, the audit determined that TransCanada has developed effective methods to manage the training and qualification of its employees and contractors as follows:

- Learning Management System (LMS), a web-based tool to document competency evaluation methods and track whether employees and contractors have been deemed qualified for a particular task;

- Active Management, a leadership tool to actively assign and monitor work, provide feedback, and provide ongoing review of staff competency;

- Practice of Engineering (POE), which defines the required professional registration for engineering staff, defines scope of practice and specifies qualifications for the Engineer-in-Charge; and

- Performance Management Process, used to establish annual performance expectations and document the development and training plan of each employee.

Management System Audit Sub-Element Finding: Based on documents reviewed and interviews with personnel, TransCanada was able to demonstrate that it was in compliance with the requirements of the OPR-99 and CSA Z662-11, and is therefore compliant with the requirements of this audit sub-element.

Compliance Status: Compliant

3.4 Communication

Expectations: The Company shall have an adequate, effective and documented communication process(es):

- to inform all persons associated with the Company's facilities and activities (interested persons) of its management and protection programs policies, goals, objectives and commitments;
- to inform and consult with interested persons about issues associated with its operations;
- to address communication from external stakeholders;
- for communicating the legal and other related requirements pertaining to the management and protection programs to interested persons;
- to communicate the program's roles and responsibilities to interested persons.

CSA Z662-11 Clauses 3.1.2 (d) and 3.2

Audit Assessment

This Management System sub-element was not formally assessed during the Integrity Management Program audit.

Compliance Status: Not Assessed

3.5 Documentation and Document Control

Expectations: The Company shall have documentation to describe the elements of its management and protection programs- where warranted. The documentation should be reviewed and revised at regular and planned intervals. Documents should be revised immediately where changes are required as a result of legal requirements or where failure to make immediate changes may result in negative consequences. The Company should have procedures within its management and protection programs to control documentation and data as it relates to the risks identified in element 2.0.

Audit Assessment

This Management System sub-element was not formally assessed during the Integrity Management Program audit.

Compliance Status: Not Assessed

3.6 Operational Control-Normal Operations

Expectations: The company shall establish and maintain a process to develop, implement and communicate mitigative, preventive and protective measures to address the risks and hazards identified in elements 2.0 and 3.0. The process shall include measures to reduce or eliminate risks and hazards at their source.

References:

OPR-99 sections 4, 27, 36, 37, 39 and 40
CSA Z662-11, Clause 3.1.2(f), 3.2 and 10

Audit Assessment:

General

During interviews and in documents submitted, TransCanada stated that it establishes and maintains processes to develop, implement and communicate surveillance and condition monitoring, and preventive, protective, mitigative, and remedial measures to address identified risks and threats.

Once TransCanada has completed its risk analysis and threat identification, integrity actions are selected to control and manage identified and potential threats. The selected actions are documented in TransCanada's annual Pipe and Facility Maintenance Plans (Maintenance Plans). Following implementation of the Maintenance Plans, the results are analyzed as part of TransCanada's improvement cycle. The audit confirmed that the processes for the development of the Maintenance Plans are documented in TransCanada's Integrity Management Programs (IMPs). The relevant sections of the IMPs are:

- Gas Pipeline IMP, Sections 11 and 12;
- Liquid Pipeline IMP, Sections 6 and 9; and
- Plant IMP, Sections 4 and 5.

TransCanada's Pipe Integrity Threat Management Programs (Threat Management Programs) provide a listing of appropriate integrity measures employed for managing specific types of threats. The Threat Management Programs are as follows:

- Mechanical Damage Threat Management Program (TEP-ITM-MECH, EDMS No. 006786487);

- External Corrosion Threat Management Program (CDN) (TEP-ITM-ECOR, EDMS No. 006570955);
- Internal Corrosion Threat Management Program (TEP-ITM-IC, EDMS No. 006786402);
- Stress Corrosion Cracking Threat Management Program (TEP-ITM-SCC-CDN, EDMS No. 005767613);
- Equipment Failure Threat Management Program (TEP-ITM-EQUIP, EDMS No. 006786449);
- Incorrect Operations Threat Management Program (TEP-ITM-IOPS, EDMS No. 006810297);
- Construction and Manufacturing Threat Management Program (TEP-ITM-MANUF, EDMS No. 006786458);
- Weather and Outside Forces Management Program (TEP-ITM-WOF, EDMS No. 005767611); and
- Facility Pipe Threat Management Program (CDN) (TEP-ITM-FPIPE-CDN, EDMS No. 007379193).

The reviewed threat control and risk reduction activities employed by TransCanada can be divided into the following five categories (discussed in more detail below): surveillance and condition monitoring; proactive measures; preventive measures; mitigative measures; and remedial measures. These threat control and risk reduction activities are addressed within the Gas Pipeline IMP, Liquid Pipeline IMP, and the Plant IMP, as well as within the individual Threat Management Programs.

Surveillance and Condition Monitoring

Surveillance and condition monitoring is used to detect the presence of threats and monitor threat progression. TransCanada's activities associated with surveillance and condition monitoring include:

- Pipeline patrols (TOP Pipeline Right of Way Procedures Canada (EDMS No. 003672613), TOP Aerial Pipeline Patrol (EDMS No. 003672387) and Pipeline Ground Based Patrols (EDMS No. 003875137));
- Leak detection surveys (Natural Gas Leak Detection Procedure Canada (EDMS No. 003676669));
- Cathodic protection surveys (TEP-CP-PRGM Corrosion Prevention Program (EDMS No. 006786483) and TES-CP-SS Cathodic Protection Survey Specification (EDMS No. 003670956));

- Geotechnical and water crossing surveys (Phase I Geologic Hazards Assessment Canadian Portion of the Keystone Oil Pipeline Alberta, Saskatchewan, Manitoba, Canada (103-93179), TEP-ITM-WOF Weather and Outside Forces Management Program (EDMS No. 007773954) and TOP Pipeline Underwater Inspections (EDMS No. 003671756)); and
- Various types of facilities and equipment inspections, with some examples of these being the TransCanada Engineering Procedures (TEP) or TransCanada Operating Procedures (TOP) as follows: TEP-ITM-FPIPE-CDN Facilities Piping Integrity Management Program (EDMS No. 007379193), TEP-ITM-EQUIP Equipment Failure Threat Management Program (EDMS No. 006786449), TOP Critical Gas Pressure Regulator Inspection and Maintenance (DEMS No. 007585439), TOP Valve and Valve Operator Inspection and Servicing (EDMS NO. 003849601), TOP Control Valve Inspection Canada and Mexico (EDMS No. 003832589) and TOP Pipeline Pressure Relief Valve Blow Off Valve Inspection (EDMS No. 003866831).

Preventive Measures

Preventive measures are intended to eliminate or prevent the presence of a threat and may include improved manufacturing and construction practices, improved material selection, increased security, public awareness activities and signage. The Board reviewed several TransCanada Operating Procedures (TOPs) that describe and direct TransCanada's Public Awareness Program (PAP). TransCanada's PAP is intended to eliminate or reduce potential third-party damage through communications with the public, excavators and contractors, emergency officials and local public officials. The Public Awareness Program is documented in the TOP Pipeline Public Awareness Program Plan (EDMS No. 003860909). The TOP One Call and Locating and Marking Procedures Canada (EDMS No. 003671859) details the necessary steps to complete prior to undertaking activities such as any ground disturbance, heavy equipment travel, excavating, blasting, or construction within 30 meters of facilities. The TOP TransCanada Signage Procedure (EDMS No. 003676680) provides information on sign types, sizes, content and posting areas, depending on the intent of the sign. While documents were received with respect to TransCanada's PAP, it was not assessed in detail in this IMP audit.

Protective Measures

Physical protective measures are intended to guard the pipeline and facilities equipment against damage and failure. Coatings are an example of protective measures, as they are intended to separate the pipe from sources of corrosion. The consensus in industry is that corrosion prevention is most effective when a high integrity coating is used in conjunction with cathodic protection. The Board reviewed TransCanada's Corrosion Prevention Program (TEP-CP-PRGM,

EDMS No. 006786483, TES-CP-CR Cathodic Protection Criteria Specification EDMS No. 00378793, and TES-CP-SS Cathodic Protection Survey Specification EDMS No. 003670956) detailing the characteristics of its program to mitigate corrosion on protected structures using cathodic protection and assessed it to be adequate.

Mitigative Measures

Mitigation methods are intended to reduce failure probability or failure consequences, and include methods such as pressure reduction, pipe material upgrades, slabbing over pipelines, increased backfill, equipment upgrades, pipeline rerouting, corrosion inhibitor injection, secondary containment and pig cleaning runs. The methods considered for risk reduction and threat control depend on the threat type. During the audit, the Board noted that TransCanada's IMPs, as well as the Threat Management Programs, included adequate mitigative options to address potential threats and risks. For example, preventive and mitigative measures are detailed in Section 9 of the Liquid Pipeline IMP.

Remedial Measures

Remediation is completed to correct known issues, such as pipeline defects and excessive stresses due to geotechnical concerns (e.g. ground movement). Data inputs, such as defect assessments, hydrostatic testing, monitoring measurements, and indirect examination results are analyzed to identify areas requiring further investigation and/or repairs. During the audit, the Board noted that TransCanada's Threat Management Programs and IMPs reference specific procedures for gathering additional data, analyzing monitoring and assessment results, and assessed them as being adequate.

The audit examined examples of TransCanada's procedures for analyzing in-line inspection results, where imperfections are evaluated to determine threats to the integrity of the pipeline. Special consideration is given to features such as dents, girth welds or seam welds that might be associated with other conditions. The following TransCanada procedures detail the approaches to analyze in-line inspection results:

- Analysis of Deformation In-Line Inspection Data for Canadian Pipelines (TEP-ILI-DEF-CDN, EDMS No. 006980190);
- Analysis of EMAT Crack Detection In-Line Inspection Data for Gas Pipelines (TEP-ILI-EMAT, EDMS No. 006980178);
- Analysis of Hard Spots in In-Line Inspection Data (TEP-ILI-HS, EDMS No. 006980212); and
- Analysis of In-Line Inspection Data (TEP-INT-ILI-CDN, EDMS No. 006570876).

Activities such as direct evaluation and hydrostatic testing may be required to further characterize suspected and identified features. Methods of defect repair include recoating, pipe cut-outs and strain reliefs, as well as installation of sleeves, composite reinforcement wraps and clamps. Assessments and anticipated remedial measures are then included in TransCanada's Maintenance Plans.

Defect Assessment and Repair Procedures

For investigation of known or suspected features, non-destructive testing methods may be used, and might require pipeline exposure. A temporary reduction in operating pressure or other safety measures may be implemented to ensure that safety is maintained. Analysis of the data gathered in consideration of the design, material, construction, operating and maintenance history and expected operating conditions of the pipeline determines appropriate remediation and repair methods necessary to return the pipeline to full service. During the audit, the Board reviewed TransCanada's procedures that are relevant to these activities:

- TOP Pipeline Restriction Procedure (EDMS No. 003820831);
- TOP Pipeline Defect Assessment and Repair Procedures (EDMS No. 003674615);
- TOP Maximum Pressure for Pipelines With Known or Suspected Integrity Concerns (EDMS No. 003671945); and
- Assessment of Features in Pipelines (TEP-INT-FASS, EDMS No. 004214235).

The Board also reviewed records of TransCanada's voluntary pressure restrictions that were in place during pipe exposure, defect assessment and repair and noted that TransCanada had followed its required procedures.

Hydrotest Procedures for Defect Testing

Pressure testing is a method that produces a pass/fail result for defects contained in the pipeline test segment. Defects detected through pressure test failures are remediated by removal/replacement of the affected pipe segment. Hydrostatic Test Specification for Integrity Testing of Existing Pipelines (TES-HYDRO-HT4, EDMS No. 003697288) describes the procedure for pressure testing an existing pipeline to validate its suitability for continued operation at a previously qualified maximum operating pressure. During the audit, the Board reviewed TransCanada's hydrotest procedure and assessed it as being adequate.

Approving, Documenting and Communicating the Maintenance Plans

Maintenance Plans for the remedial activities described previously are presented to TransCanada management for review and approval. For Pipe Integrity, information on the Maintenance Plan is communicated as per Pipe Integrity Communication Procedure (TEP-INT-COMM, EDMS No. 006980248). The Vice President of Engineering and Asset Reliability approves the Maintenance Plans for Pipe Integrity and Facilities Integrity. Preventive maintenance work is communicated, documented and tracked in Avantis, which is a maintenance management system that is used by TransCanada.

Maintenance Plan Implementation

Maintenance Plans are implemented by integrity personnel, central planning personnel, regional staff, and project managers of Pipeline Maintenance Projects, as appropriate. A program schedule is developed based on the urgency of risk reduction, operational efficiencies, resource and material availability and access. Repair or mitigation of known conditions may be scheduled independently of other activities if an urgent action is required. If a planned activity cannot be completed within the established timeframe, justification for the deferral and an explanation of why the change will not jeopardize integrity are documented through either a variance (System Improvement Decision Summary Variance Approval, EDMS No. 003909431) or a management of change (TEP-INT-MOC Pipe Integrity Management of Change Procedure, EDMS No. 006425143), as appropriate. A temporary reduction in operating pressure or other appropriate actions may be required. Section 12 of the Gas Pipeline IMP, Section 7 of the Liquid Pipeline IMP, and Sections 4 and 5 of the Plant IMP address implementation of the Maintenance Plans.

Conducting Maintenance Plans

TransCanada stated that all surveillance and condition monitoring, as well as preventive, protective, mitigative and remedial activities, are conducted, managed and monitored in a manner that is intended to minimize environmental and safety risks. The Health, Safety and Environment (HS&E) Management System (EDMS No. 003721961) contains more specific information on how these risks are managed. HS&E was not in the scope of the audit and was therefore not assessed during this IMP audit.

Maintenance Plan Evaluation and Communication

Evaluations of the effectiveness of Maintenance Plans are completed periodically by TransCanada's Integrity Program Managers, Threat Program Managers, and Integrity Plan owners in consideration of the following:

- past and current assessment results;

- data integration and risk assessments;
- remediation results;
- performance of new technology or applications;
- non-conformances/non-compliances;
- performance measures; and
- incident investigations.

The maintenance plan evaluation results may be used to modify the programs, if required. For Pipe Integrity, the evaluations are documented in threat-specific Pipeline Maintenance Annual Reports and in the Assessment Plan for hazardous liquids. The Pipeline Maintenance Plan Annual Reports are communicated to management as per the Pipe Integrity Communication Procedure (TEP-INT-COMM, EDMS No. 006980248). For Facilities Integrity, Maintenance Plan results are communicated to management through performance measure reports, activity reports and integrity plans.

Summary: Operational Control-Normal Operations

The Management System Audit Element 3.6, Operational Control – Normal Operations, requires a company to establish and maintain a process to develop, implement and communicate measures meant to mitigate, prevent and protect against the hazards identified in sub-sections 2.0 and 3.0. This includes measures to proactively reduce or eliminate risks and hazards at their source.

The audit determined that TransCanada's threat management programs provide a listing of appropriate integrity measures for managing identified risks and threats. Some of these threats include but are not limited to: pipeline corrosion; construction and manufacturing; weather and outside forces; and mechanical damage.

TransCanada was found to manage these risk and threats through in the following ways:

- Surveillance and condition monitoring used to detect the presence of threats and monitor threat progression;

- Preventative measures intended to eliminate or prevent the presence of threats such as improved material selection, public awareness activities and signage;

- Physical protective measures intended to protect infrastructure from damage and failure such as pipeline coating to prevent corrosion;

- Mitigation measures to reduce the probability of failure and related consequences such as pipeline rerouting, pressure reductions and equipment upgrades;

- Remediation to correct known issues (including maintenance plan development, implementation evaluation and communication);

- Non-destructive testing methods to investigate known or suspected anomalies; and

- Hydrotesting that produces a pass/fail result for defect identification.

Management System Audit Sub-Element Finding: Based on documents reviewed and interviews with personnel, TransCanada was able to demonstrate that it was in compliance with the requirements of the OPR-99 and CSA Z662-11, and is therefore compliant with the requirements of this audit sub-element.

Compliance Status: Compliant

3.7 Operational Control-Upset or Abnormal Operating Conditions

Expectations: The company shall establish and maintain plans and procedures to identify the potential for upset or abnormal operating conditions, accidental releases, incidents and emergency situations. The company shall also define proposed responses to these events and prevent and mitigate the likely consequence and/or impacts of these events. The procedures must be periodically tested and reviewed and revised where appropriate (for example, after emergency events).

References:

OPR-99 sections 4, 32, 37, 40 and 52
CSA Z662-11, Clauses 3.1, 3.2, 4.18, 10.9.5

Audit Assessment:

General

During interviews and in documents submitted, TransCanada stated that it has the operational controls and procedures that are to be followed to identify the potential for operational upset or abnormal operating conditions, and it has developed the plans and procedures to prevent and mitigate the impacts of these upset or abnormal operating events. TransCanada also submitted procedures that would be implemented in response to pipeline and facilities upset or abnormal operating conditions, including accidental releases, incidents or emergency situations. TransCanada's emergency response plan (ERP) was not within the scope of this audit and was therefore not assessed during this IMP audit.

Pipelines – SCADA

Oil Control Operations

The Keystone Pipeline is remotely monitored and controlled from TransCanada's Calgary based Oil Control Centre (OCC). Pipeline controllers at the OCC are responsible for the overall operation of the pipeline 24 hours a day, 365 days a year. Pipeline controllers monitor critical data points along the pipeline and are able to issue supervisory commands such as pump start/stop and valve open/close commands using a computerized Supervisory Control and Data Acquisition (SCADA) system. To address service reliability, the OCC has fully redundant SCADA and leak detection systems. In the event of a SCADA or leak detection system failure, a hot standby system will immediately take over. If both the OCC primary and standby systems become unavailable due to a catastrophic event, a secondary Back-Up Control Centre contains

full duplicate primary and secondary SCADA and leak detection systems. CSA Z662-11, Annex M (Informative), Guidance for System Control, Monitoring and Protection of Liquid Pipelines, provides non-mandatory guidance for the use of SCADA. TransCanada's use of a SCADA system for the Keystone Pipeline conforms to this non-mandatory guidance.

The Keystone Pipeline is operated in accordance with its written operating procedures for normal, abnormal and emergency operations. TransCanada stated that the procedures comply with CSA Z662-11, Clause 10.5.2, Pipeline Emergencies. OCC procedures are documented and available to the OCC controllers via an internal OCC website. The OCC procedures include normal operations, abnormal/emergency operations, leak detection operations and incident management. The OCC emergency procedures were outside the scope of this IMP audit and were not formally assessed.

Examples of TransCanada's Operating Procedures (TOPs) provided to support operational control are: TOP Emergency Shutdown System Inspection (EDMS NO. 003830466), TransCanada Commissioning Procedures, Station Control System and Commissioning Check Sheet - Station Control System (both documents have an effective date of 2012/05/01 but have no document ID numbers), and SCADA Mainline Unit speed Control Commissioning Guide (Document ID N/A, but the internal TransCanada Website address is given as http://wscada).

Gas Control Operations

TransCanada's gas pipeline operations are remotely monitored and controlled from the Calgary Gas Control (GC) Centre. Pipeline controllers are responsible for the overall operation of the pipeline 24 hours a day, 365 days a year. The pipeline controllers monitor critical data points along the pipeline and are able to issue supervisory commands such as compressor start/stop and valve open/close commands using a computerized SCADA system. To address service reliability, the Gas Control SCADA systems are fully redundant. If the primary SCADA system fails, a hot standby system will immediately take over. If both the Gas Control primary and standby systems become unavailable due to a catastrophic event, a secondary Back-Up Control Centre contains a full duplicate primary and secondary Gas Control SCADA system. CSA Z662-11, Annex M (Informative), Guidance for System Control, Monitoring and Protection of Liquid Pipelines, provides non-mandatory guidance for the use of SCADA for liquids pipelines only. TransCanada's use of a SCADA system for its gas pipeline operations is voluntary and conforms to the intent this non-mandatory guidance.

TransCanada's gas pipeline system is operated in accordance with written operating procedures for normal, abnormal and emergency operations. TransCanada stated that the procedures comply

with CSA Z662-11, Clause 10.5.2, Pipeline Emergencies. Gas Control consists of two processes, the Monitor and Control Process (EDMS No. 003835728) and the Emergency Preparedness and Response Process (EDMS No. 003835729). The Monitor and Control Process describes the methodology used to ensure that the 24-hour operation of the pipeline system is carried out under controlled conditions. The Emergency Preparedness and Response (ERP) Process describes the methodology used to ensure programs, processes and plans are in place to ensure controlled responses to emergency situations. While TransCanada provided information on its emergency preparedness and response program, its ERP program was not formally assessed in this IMP audit.

Facility Automation

Oil Operations

During the audit interviews, TransCanada stated that the Keystone Pipeline pump stations and all other oil pipeline facilities, including terminals and pipeline isolation valve sites, are equipped with fully automated control systems. These control systems monitor critical parameters, such as pressures and flows, 24 hours a day, 365 days a year, and will automatically regulate these parameters as required. If any parameter exceeds normal operating limits, the local control system will automatically shut down the oil facility. Key elements of the facility control systems, as related to abnormal or emergency operations, are: facility emergency shutdown (ESD) and isolation; pressure control and overpressure protection; and fire detection.

Gas Operations

During the audit interviews, TransCanada stated its compressor stations are equipped with fully automated control systems. These control systems monitor critical parameters, such as pressures and temperatures, 24 hours a day, 365 days a year, and will automatically regulate these parameters as required. If any parameter exceeds normal operating limits, the local control system will automatically shut down the facility. Key elements of the gas facility control systems, as related to abnormal or emergency operations, are: facility ESD and isolation; pressure control and overpressure protection; and fire and gas detection.

CSA Z662-11, Clause 10.9.1.1, Compressor and Pump Units, states that *"Gas compressor and pump units shall be started, operated, and shut down in accordance with procedures established by the operating company"*. TransCanada's facility automation for both its oil and gas operations is in compliance with the requirements of CSA Z662-11.

Station ESD and Isolation

Oil Operations

During the audit interviews, TransCanada stated that its pump stations are equipped with an ESD system that is designed to automatically isolate the station from the pipeline upon the occurrence of abnormal conditions. An ESD event will result in the immediate shutdown of all pumps, both the mainline pumps as well as sump re-injection pumps. Once the pumps have shut down, the station mainline bypass valve opens and station suction and discharge side valves close. The station valves are interlocked so that the station suction and discharge side valves do not close until the station mainline bypass valve is fully open. Once a pump station is in emergency shutdown, it is locked out to the OCC until the incident is investigated and cleared by a facility technician. An "Isolate" command is also available to the OCC and is intended for non-emergency isolation at the pump station. This will result in the station bypass valve opening and the side valves closing, but will not lock out the facility to the OCC. Similar ESD systems are in place at oil receipt facilities.

CSA Z662-11, Clause 4.14.3.3(a) states that "*Pump stations shall have emergency shutdown systems that meet the following requirements: (a) Such systems shall provide a means to block liquids out of the station.*" TransCanada is assessed to be compliant with this requirement. The OPR-99, section 12(a) states that "*A compressor station or pump station shall be equipped with an alternate source of power capable of (a) operating the station's emergency shut-down system*". On 6-9 June, 2011, NEB staff conducted an inspection of Keystone's Portage La Prairie, Rapid City, Moosomin and Richardson pump stations located in Manitoba and Saskatchewan. The inspection revealed that the pump stations on the Keystone system are not equipped with an alternate source of power capable of operating each station's ESD system and NEB staff identified this as a non-compliance with subsection 12(a) of the OPR-99.

On 17 August 2012, the Board issued Order SO-T241-002-2012 directing TransCanada to provide a corrective action plan to address a non-compliance to the OPR-99 sub-section 12 (a). TransCanada had been found non-complaint with the OPR-99 sub-section 12 (a) because it did not have an alternate source of power capable of operating its pump station's ESD systems. The Board accepted TransCanada's corrective action plan with Amending Order AO-001-SO-T241-002-2012 on 15 October 2012. The corrective action plan is being implemented and all corrective actions are to be completed by 31 March 2014.

Gas Operations

If the facility programmable logic controller (PLC) detects a fire or high gas concentration, or an over-pressure condition, it automatically initiates a plant ESD. The ESD will isolate the affected plant by closing all adjacent yard valves and opening blow-off valves to vent yard piping. A fire condition will also cause plant fire suppression systems to activate, where installed.

Pressure Control and Over-Pressure Protection

Oil Operations

TransCanada stated that its oil pressure control and over-pressure protection systems are designed in accordance with CSA Z662-11, Clause 4.18.2: General Design Requirements for Systems for Pressure Control and Over-pressure Protection, to ensure that the failure of either system will not cause the other to become inoperative.

Pump station suction and discharge pressures are controlled via a combination of pump speed control and pressure control valve modulation. The majority of pump stations are fitted with variable frequency drives to control pump speed, and all pump stations are fitted with a pressure control valve on the discharge side of the pump station. Upon loss of the control system, all pumps at that station will trip and SCADA will drive the upstream pump station to safe discharge pressure settings.

Pump station suction and discharge pressures are monitored by the local facility control system and the SCADA system for over-pressure conditions. If suction pressures exceed safe limits, all pumps at all stations upstream of the station with the high suction pressure will be immediately shut down. If discharge pressures exceed safe limits, all pumps at that station will be immediately shut down. If the SCADA system detects a blocked flow path (such as a valve closure) anywhere on the pipeline, then all pumps at all stations upstream of the facility with the blocked flow will be immediately shut down.

Gas Operations

TransCanada's Gas Control Over-Pressure Procedure (EDMS No. 003723302) references six levels of protection to prevent pipeline over-pressure. Four levels of protection take place at compressor station locations and protect against over-pressure conditions that are initiated by the compressor station only. The fifth and sixth levels of protection, which augment the compressor station controls, protect against other sources of pipeline over-pressure. If an over-pressure condition occurs, a station's programmable logic controllers (PLCs) has the ability to slow down the operating parameters of the unit, shut down the unit completely, or relieve the pressure via

unit or station relief valves. TransCanada stated that typically, over-pressure protection is also provided at upstream producer facilities. Requirements for these protection systems are directed under the Gas Tariff.

Over-Pressure Hazard

The Board identified a non-compliance with this audit element related to the management of the over-pressure hazard on the NOVA Gas Transmission Ltd. (NGTL) system receipt meter stations. The Board determined that NGTL is not conducting sufficient inspections or audits of its customer's installations to ensure that the NGTL system is operated in compliance with CSA Z662-11, Clauses 4.18.1.1, 4.18.1.2 and 4.18.2, and as required by the OPR-99 sections 4 and 53(1).[3]

CSA Z662-11, Clause 4.18.1.2 states that "*where failure of the pressure-control system, or other causes, can result in the maximum operating pressure of the piping being exceeded, overpressure protection shall be installed to ensure that the maximum operating pressure is not exceeded by more than 10% or by 35 kPa, whichever is greater.*"

The CSA Z662-11 design requirements for over-pressure protection (OPP) are specified in sub-clause 4.18.2 as:

"Systems for pressure control and over-pressure protection shall:

(a) be designed such that a failure in either system cannot cause the other system to become inoperative;

(b) be designed with sufficient capacity and sensitivity for the intended service;

(c) be designed for the intended service environment;

(d) be designed and installed so that they can be readily tested, inspected, and calibrated;

(e) be designed and installed to prevent unauthorized operation of valves or equipment that would make these systems inoperative;

(f) be designed to minimize the risk of being physically damaged; and

(g) where practicable, be designed such that a failure will not result in an over-pressure condition of the piping".

The NEB has reviewed TransCanada's past incident history and identified over-pressure incidents on the NGTL system. Through an Audit Information Request and audit interviews with TransCanada, TransCanada was asked to demonstrate how the NGTL approach of relying on its customers and NGTL's General Terms and Agreement (GTA) meets the requirements of CSA

[3] See the amended and re-named *National Energy Board Onshore Pipeline Regulations*, sections 4 and 53(1), for the corresponding provisions.

Z662-11, Clause 4.18 and the OPR-99 sections 4 and 53(1). In addition, NGTL was asked whether it had implemented the preventative actions highlighted in the NEB's Safety Advisory (NEB SA99-1), which referenced the requirements of CSA Z662-11, Clause 4.18.1.2, on OPP at Receipt Points, issued in September 1999.

TransCanada stated that, as a result of its over-pressure incidents, it had initiated a review of how its customers meet the GTA. TransCanada stated that in December 2010 it implemented a procedure for new meter stations that verifies that the customer's OPP meets CSA Z662-11 requirements. TransCanada stated that it has reviewed its customers' philosophies concerning how they meet the GTA for 30 receipt meter stations and that it is currently developing a plan to verify compliance to OPP requirements on approximately 1100 additional receipt meter stations.

Further, TransCanada indicated that in February 2012, it had communicated the following OPP Plan of Action to its customers:

- TransCanada will re-initiate verification of its OPP requirements with NGTL customers in April 2013.
- NGTL stakeholders (including customers) will be informed at that time that in order to be compliant with CSA Z662-11, the OPR-99 and NEB Safety Advisories, NGTL will require information from all Interconnecting Operators at receipt meter stations regarding the status of their OPP Systems.
- Failure to provide adequate information regarding the status of the Interconnecting Operator's OPP System may ultimately result in either the shut-in of the receipt stations, or installation at the customer's cost of OPP systems at the NGTL receipt stations.
- A risk-based methodology is used to determine the meter station information required to allow both TransCanada and its customers to prioritize the meter stations under initial review in 2013. The balance of the meter station information will be required and reviewed by the end of 2014.
- Currently, meter stations with one or more of the following characteristics are prioritized to provide OPP information:
    - The meter station has an automated block valve;
    - The meter station has had a prior over-pressure event; and
    - The meter station has one or more producer tie-ins where there are a number of unclear areas on how to ensure OPP. In such cases OPP information will be required from all of the applicable upstream operators.

Based on the history of over-pressure incidents on the NGTL system, the fact that TransCanada only recently initiated a Plan of Action to verify compliance with the OPP requirements of CSA

Z662-11, Clause 4.18, and the fact that the Plan of Action has not been fully implemented, TransCanada is not in compliance with this audit sub-element.

Pressure-Limiting and Pressure-Relieving Systems

Oil Operations

Relief valves on the Keystone Pipeline are tested annually, as directed under TransCanada's Relief Valve Inspection and Overhaul Maintenance for Oil Pipelines Procedure (EDMS No. 007603025), and in accordance with CSA Z662-11, Clause 10.9.5.3. TransCanada is currently assembling the supporting evidentiary data as required by CSA Z662-11, Clause 10.9.5.3(b) to assess and justify an appropriate alternate pressure-relief system inspection and maintenance interval for these facilities.

Gas Operations

The audit identified that settings for mechanical relief valves, as well as pressure relief set-points coded into the control system, are managed according to TransCanada's document Compressor Station Limits Canada (EDMS No. 003671820).

During the audit, TransCanada stated that it overhauls conventional and pilot-operated pressure relief valves at three or five-year intervals, in accordance with CSA Z662-11, Clause 10.9.5 Pressure-control, pressure-limiting and pressure-relieving systems and/or API 576, Inspection of Pressure Relieving Devices. CSA Z662-11, Clause 10.9.5.3(b) states that *"pressure-relieving systems (or devices), except for rupture disks, shall be inspected, assessed, and tested, at least once per calendar year with a maximum interval of 18 months (Clause 10.9.5.3(a)) or at intervals appropriate to their application and operation, as determined by the operating company, as specified in API 576, and in accordance with supporting evidentiary data and documentation (Clause 10.9.5.3(b))."*

The audit determined that TransCanada is moving to a five-year inspection and maintenance interval for its pressure-relief inspection and maintenance program, as it assesses the requirements for each site under its internal audit process according to the TOP Pressure Relief Valve Audit Procedure (EDMS No. 003954090). TransCanada's Pressure Equipment Quality Management System (QMS) and CSA Z662-11, Clause 10.9.5.3(b) both require TransCanada to review the equipment to justify extension of inspection intervals. TransCanada stated that, to date, no incidents have listed the longer pressure-relief inspection and maintenance interval as a contributing factor, and no increase in relief valve incidents have occurred since the move to the longer interval was initiated. Based on the evidentiary data and documentation as required by

CSA Z662-11, Clause 10.9.5.3(b), TransCanada's rationale for the increased inspection interval is in compliance with requirements for pressure-relief valve inspection and maintenance.

Leak Detection

Oil Operations

The audit identified that TransCanada's leak detection methodology on oil systems is performed via a computerized Leak Detection system that alerts the Oil Control Centre (OCC) controller of any suspected leak event, so that the controller can take appropriate action to shut down and isolate the pipeline system. In addition, aerial patrols are performed 26 times a year (TOP Aerial Pipeline Patrol, EDMS No. 003672387). If a leak is identified during an aerial patrol, the OCC is notified to immediately shut down and isolate the system. CSA Z662-11, Clause 11.18, Leak Detection, requires that "*Where appropriate, pipelines shall have leak detection systems. Leak detection devices and procedures, where used, shall be capable of providing early detection of leaks. Where appropriate, line balance methods may be used.*" TransCanada's leak detection system for its oil operations is in compliance with the CSA Z662-11 requirements.

Gas Operations

During the audit, TransCanada stated that if a leak is detected or suspected on a gas pipeline, the guidance provided under the Pressure Control of Leaking Pipelines (EDMS No. 003841207) is followed to manage the confirmed or suspected leak. Leak detection on gas pipeline systems is also performed via regularly scheduled aerial and ground based patrols in accordance with the Natural Gas Leak Detection Procedure (EDMS No. 003676669) and the Pipeline Integrity Leak Detection and Evaluation Procedure (TEP-INT-LEAK, EDMS No. 007379105). These procedures describe the requirements to perform natural gas leak detection activities. CSA Z662-11, Clause 11.18, Leak Detection, requires that "*Where appropriate, pipelines shall have leak detection systems. Leak detection devices and procedures, where used, shall be capable of providing early detection of leaks. Where appropriate, line balance methods may be used.*" TransCanada's leak detection system for its gas operations is in compliance with the CSA Z662-11 requirements.

Gas Quality

As mentioned in the audit sub-element 4.1 Inspection, Measurement and Monitoring, TransCanada has identified key personnel, such as field technicians and gas controllers, who are trained to identify and manage gas quality off-specification Tariff conditions. The governance and systematic approach to managing gas quality are outlined in the Gas Quality Procedure (EDMS No. 003671916) and the H_2S Risk Mitigation Procedure (EDMS No. 003999947). At

locations where sour potential or other contaminants are of concern, additional instrumentation and automated equipment is employed with shut-in capability. In the event that a sour gas slug is introduced to the pipeline system, the Alberta and Foothills System H_2S Contamination Procedure (EDMS No. 003723279) provides procedures and guidelines for Gas Control to manage the H_2S contamination event. Records of TransCanada's gas quality monitoring program were examined in conjunction with the assessment of the Internal Corrosion Threat Management Program (Ref_2_2012 IC Susceptible Lines.xlsx). The programs that TransCanada has developed and implemented to manage gas quality are in compliance with the requirements of the OPR-99, section 6.5(1) (e) and (f).

Fire and High Gas Concentration Detection

During the audit, TransCanada stated that all stations are equipped with sensors to continuously monitor for both fire (gas and oil facilities) and high gas concentrations (gas facilities only), as per CSA Z662-11. Clause 4.14.2.7 states that "*compressor buildings shall have suitable systems for the detection of fire and hazardous atmospheres*" and Clause 4.14.3.5 states that "*pump buildings shall have suitable systems for the detection of fire and hazardous atmosphere*". TransCanada stated that, as directed by its Fire Detection Equipment Inspection Procedure (EDMS No. 005018693), the fire and gas detection equipment are tested and calibrated on prescribed maintenance schedules, typically annually or bi-annually, depending on the type of detection equipment. Fire and gas detection equipment are on an annual inspection and maintenance interval. Catalytic gas detectors have a known susceptibility to gas "poisoning" over time, which may reduce their ability to detect gas. Although catalytic gas detectors are not typically exposed to gas during normal operations, bi-annual inspections are prescribed by TransCanada as a preventive measure.

In terms of the applicable regulatory requirements for an inspection schedule, CSA Z662-11 remains silent on the inspection and maintenance interval requirements as does the American Petroleum Institute (API) and the National Research Council Canada (National Fire Code of Canada, 2010). In general terms, the OPR-99 section 36(b), states that "A company shall periodically test instruments and equipment at the pipeline stations to verify their proper and safe operation."[4] TransCanada's inspection and maintenance program frequencies for its fire and gas monitoring equipment are therefore assessed to be compliant with these requirements.

[4] See the amended and re-named *National Energy Board Onshore Pipeline Regulations*, section 36(b), for the corresponding provision.

Alarm Call-Out System

During the audit, TransCanada identified its gas control and oil control personnel who monitor the pipeline system and acknowledge all alarms that come in through the SCADA system. The alarms are grouped in "bundles" that allow the operator to identify from which sub-system the alarm originates. The operator then notifies the appropriate field personnel to respond to and investigate the alarm. Gas Control direction is provided under the Alarm and Event Management Procedure (EDMS No. 003821127). Oil Control direction is provided via various procedures available on the OCC web page. TransCanada's alarm call-out system relates to its emergency preparedness and response program, which was not included in the scope of this audit and therefore not formally assessed.

Shutdown Devices and Systems

During the audit, TransCanada stated that each compressor and pump station contains instrumentation and controls which include pressure transmitters, pressure switches, mainline valve pressure switches, blow-off valve high-pressure switches, level switches and mainline pressure and temperature transmitters. To ensure the equipment is configured and functions correctly, guidance is provided under the Control and Monitoring Inspection Procedure (EDMS No. 003834760). CSA Z662-11, Clause 10.9, Operation and Maintenance of Facilities and Equipment, and more specifically, sub-clause 10.9.1, Compressor and Pump Stations, states that "*gas compressor and pump units shall be started, operated, and shut down in accordance with procedures established by the operating company*". TransCanada's shutdown devices and systems are in compliance with the requirements of CSA Z662-11.

Valve Operation

TransCanada stated that remotely located mainline valves on gas pipelines are equipped with low-pressure shut-off devices which, when a low-pressure condition is observed, will automatically close the valve isolating the pipeline section. Remote mainline valves on the Keystone Pipeline are electrically actuated and can be closed and opened, as required, via remote command from the OCC.

The following procedures provide guidance to ensure that pipeline valves (oil and gas) operate as required during normal, abnormal and emergency conditions:

- Control Valve Inspection (EDMS No. 003832589);
- Gate Valve Position Inspection (EDMS No. 006493970);
- Oil Pipeline Valve and Valve Operator Inspection (EDMS No. 005505594);
- Control Valve Inspection Canada and Mexico (EDMS No. 0038332589);

- Valve and Valve Operator Leak and Cycle Test (EDMS No. 003864109); and
- Valve and Valve Operator Inspection and Servicing (EDMS No. 003849601).

CSA Z662-11, Clause 10.9, Operation and Maintenance of Facilities and Equipment, and more specifically, sub-clause 10.9.6.2, Valves, states that "*Pipeline valves that can be necessary during an emergency shall be inspected and partially operated at least once per calendar year, with a maximum interval of 18 months between such inspections and operations*." TransCanada's procedure, Valve and Valve Operator Inspection and Servicing (EDMS No. 003849601), Section 3.0 Frequency, specifies that "*inspection shall be conducted once per calendar year with a minimum interval between inspections of 18 months*." TransCanada's task package Control Valve Inspection Canada and Mexico (EDMS No. 0038332589), Section 3.0 Frequency, specifies "*the standard frequency for performing the inspection is M12 (12 months).*" Valve inspection records were reviewed during the audit (Control Valve Inspection Track WO No. 741331 and Slam Shut Inspection Track WO No. 725105) to confirm implementation of the inspection and maintenance procedures. TransCanada's procedures for its valve maintenance and inspection are assessed to be in compliance with the requirements of CSA Z662-11.

Emergency Preparedness and Response Procedure

TransCanada's emergency preparedness and response program (EMP) was not included in the scope of this IMP audit and was therefore not formally assessed.

Summary: Operational Control-Upset or Abnormal Operating Conditions

The Management System Audit Element 3.7, Operational Control – Upset or Abnormal Operating Conditions, requires a company to establish and maintain procedures to identify potential upset or abnormal operating conditions, accidental releases, incidents and emergency situations.

TransCanada has implemented a number of processes and procedures to identify potential upset or abnormal operating conditions. TransCanada's pipeline infrastructure is monitored remotely 24 hours a day, 365 days a year using a Supervisory Control and Data Acquisition (SCADA) system and is backed up by an onsite standby system. In the event that both of these systems fail due to a catastrophic event, a secondary control centre at a different location contains full duplicate primary and secondary back-up systems.

This audit also found that TransCanada's pressure-limiting and relieving systems, leak detection, gas quality, alarm call-out, shutdown devices and valve operation systems were all adequate and compliant with the OPR-99 and CSA Z662-11 requirements.

While over-pressure protection for TransCanada's oil pipeline systems was found to be adequate, the Board has determined the NOVA Gas Transmission Ltd (NGTL) system is not conducting sufficient inspections or audits of its customer installations to ensure that the system is operated in compliance with the OPR-99 and CSA-Z662-11 requirements. Based on that system's history of over-pressure incidents and the fact that TransCanada has not fully implemented its plan of action to verify compliance with requirements, the company is not in compliance with the OPR-99 and CSA-Z662-11 requirements and is therefore not in compliance with this audit sub-element.

Management System Audit Sub-Element Finding: Based on the documents assessed and interviews with personnel for programs related to over-pressure protection systems on the Alberta (NGTL) System, TransCanada is assessed to be non-compliant with the requirements of the OPR-99 and CSA Z662-11, and is therefore non-compliant with this audit sub-element.

Compliance Status: Non-Compliant

4.0 CHECKING AND CORRECTIVE ACTION

4.1 Inspection, Measurement and Monitoring

Expectations: The company shall develop and implement surveillance and monitoring programs. These programs should address contract work being performed on behalf of the company. These programs should include qualitative and quantitative measures for evaluating the management and protection programs and should, at a minimum, address legal requirements as well as the risks identified as significant in elements 2.0 and 3.0. The company should integrate the surveillance and monitoring results with other data in risk assessments and performance measures, including proactive trend analyses. The company shall have documentation and records of its surveillance and monitoring programs.

OPR-99 sections 4, 27, 28, 36, 37, 39, 47, 48, 53 (1) and 54 (1)
CSA Z662-11, Clauses 3.1.2(h)(i), 3.2, 9 and 10

Audit Assessment:

General

During interviews and in documents submitted, TransCanada indicated that it has developed and implemented surveillance and monitoring programs to address the hazards and risks to its pipeline systems. TransCanada's Engineering and Asset Reliability (E&AR) department is accountable for identifying the relevant programs and for ensuring adherence of these programs to applicable regulations. Subsequent trending and evaluation of the programs provide input to ensure continued effectiveness of the Integrity Management Programs (IMPs).

It was noted that TransCanada's processes for monitoring and analyzing hazards are identified within the Quality Management, Quality Assurance and Management Review sections of TransCanada's IMPs.

Surveillance and Condition Monitoring Programs

Gas Quality Monitoring

During the audit, TransCanada identified personnel, such as field technicians and gas controllers, who are trained to identify and manage gas quality off-specification conditions. The governance and systematic approach to managing gas quality are outlined in the Gas Quality Procedure

(EDMS No. 003671916). At locations where sour potential is of concern, additional instrumentation, sour bottles and automated equipment are employed to ensure that off-specification gas (>16 ppm H_2S) does not enter the mainline or reach a sales location.

Testing methods used to manage the gas quality can include:

- manual water and hydrocarbon dew points;
- gas samples (carbon dioxide, oxygen, and heating value);
- hydrogen sulphide and total sulphur screening via gas samples and on-line instrumentation;
- objectionable material detection via dew point monitoring;
- orifice plate inspection;
- H_2S gas sniffer analysis; and
- scrubber and meter run inspections.

There are currently 292 receipt meter stations with H_2S protection on the NOVA Gas Transmission Ltd. (NGTL) system. The TransCanada philosophy for sour meter station design is to monitor, control, contain, and reject a customer's gas if off-specification gas is detected. In addition, all receipt and delivery meter stations are screened monthly via gas samples for H_2S and total sulphur levels, and sweet stations are tested monthly through H_2S gas sniffer tubes. Several mainline H_2S analyzers are also installed throughout the NGTL system to detect potential H_2S slugs that may have entered the system.

The audit identified that all TransCanada meter stations and compressor stations contain gas scrubber equipment. Any recovered liquids are measured on a regular basis. Excessive liquid recovery prompts the applicable customer to rectify the problem.

Non-sour off-specification conditions are managed directly with the customers and may include shutting in the customer until the off-specification condition is rectified. As outlined in the TransCanada Operating Procedure (TOP) Meter Station General Maintenance Gas Transmission (EDMS No. 003834481), the typical visitation schedule at TransCanada meter stations is monthly unless otherwise specified. TransCanada stated that the program is considered to be effective as there are no known internal corrosion defects caused by off-specification gas conditions. The absence of significant defects caused by internal corrosion was confirmed during the audit of the Internal Corrosion Threat Management Program.

With respect to specific requirements for gas quality specifications and monitoring, CSA Z661-11 remains silent. The requirements for gas quality fall under identification of hazards and subsequent development and implementation of monitoring programs for the identified hazards.

CSA Z662-11, Clause 3.1, Safety and Loss Management System and specifically Clause 3.1.2 states *"The safety and loss management system shall include the following elements: (f) operational controls, including the development of procedures for hazard identification and risk management, design and material selection, construction, operations and maintenance, pipeline system integrity management, and security management."* TransCanada was assessed to be in compliance with the requirements for control and monitoring of gas quality for its gas pipeline operations.

Table 4.1 summarizes the gas quality indices in the general terms and conditions section of each tariff.

Gas Quality Specifications	NGTL	Canadian Mainline	Foothills (SK) Zone 9	Foothills (BC) Zone 8	TQM
Hydrogen sulphide	23 mg/m3	23 mg/m3	23 mg/m3	23 mg/m3	23 mg/m3
Total sulphur	115 mg/m3	115 mg/m3	230 mg/m3	230 mg/m3	115 mg/m3
Carbon dioxide	Max 2%	Max 2%	Max 2%	Max 2%	Max 2%
Oxygen	Max 0.4%	Max 0.4%	Max 0.4%	Max 0.4%	Max 0.4%
Temperature	49ºC	50ºC	49ºC	43.3ºC	50ºC
Heating value	Min 36 MJ/m3	Min 36 MJ/m3, Max 41.34 MJ/m3	Min 36 MJ/m3	Min 36 MJ/m3	Min 36 MJ/m3
Water	Max 65 mg/m3 or min -10C @ >8,275 kPa	Max 65 mg/m3	Max 65 mg/m3 or min -10 C @ >,8275 kPa	Max 65 mg/m3 or min -10 C @ >8,275 kPa	Max 65 mg/m3
Hydrocarbon Dew Point	Min -10 C @ operating pressure	Min -10 C @ 5,500 kPa absolute	Min -10 C @ operating pressure	Min -10 C @ operating pressure	Not specified

Sediment and Water Monitoring

Sediment and water (S&W) is a measure of the residual unwanted impurities (water and particulate matter) that are contained in crude oil, which is applicable to the Keystone Pipeline. TransCanada stated that every oil batch is tested for compliance with an S&W maximum of 0.5% of volume as per Article 4.2(ii) of the Keystone Petroleum Tariff agreements. In addition to the manual testing used for custody transfer, the Hardisty terminal is equipped with an online water cut analyzer to continuously measure the receipt water cut, to ensure that off-spec product does not enter the pipeline undetected. Beyond efforts to minimize S&W within the product stream, samples of crude and sediment (sludge) were collected from early cleaning runs across the Keystone Pipeline system in order to assess its corrosivity. TransCanada identified that the exposure tests using these samples validated that, in the absence of sludge, and exposed to pipeline crude only, the corrosion rate was negligible.

Information reviewed identified that the Keystone Pipeline system was designed to minimize the potential for sediment accumulation by having a nominal flow rate that generates a turbulent flow regime (maintains water and sediment suspended and entrained in the crude). Typically, sediment deposition is unavoidable during situations such as line fill and initial start-up. Accordingly, cleaning tools were run the entire length of the system twice after initial start-up. As well, a cleaning tool is also run prior to each in-line inspection (ILI) run. By early 2013 all ILI metal loss runs on the Keystone Pipeline system in Canada will be completed. Re-inspection is currently scheduled on a five-year interval. The ILI data is specifically reviewed for indicators of the initiation and presence of internal corrosion. TransCanada stated that none of the ILI data to date has exhibited evidence of internal, under-sediment corrosion. This was confirmed during the audit of the Internal Corrosion Threat Management Program.

Another consideration in the design of the Keystone Pipeline was the minimization of dead legs, with normal flow through the barrels as one manifestation of this approach. Corrosion monitoring will be performed to confirm ongoing applicability of initial exposure tests during scheduled facility inspections, as per Keystone Facility Piping Non Destructive Inspection (EDMS No. 006790574).

CSA Z662-11, Clause 4.14.3.8 (b) states *"The designer shall avoid dead-ended piping unless corrosion is mitigated in such piping sections. Consideration shall be given to sizing piping to maintain a flow velocity sufficient to minimize the accumulation of water and sediment."* TransCanada's was assessed to be in compliance with the requirements to design to control and to monitor sediment and water in its oil pipeline operations.

H_2S Content in Crude Oil Monitoring

CSA Z662-11, Clause 16.2.1 (b) defines sour service for pipeline systems not containing a gas phase (gas-free liquid pipeline systems), such as the Keystone Pipeline, as "*service in which the effective hydrogen sulphide partial pressure exceeds 0.3 kPa at the bubble point absolute pressure*".

In its February 2013 response to an Audit Information Request, TransCanada indicated that the crude oil it carries in the Keystone Pipeline does not constitute sour service. During the audit, TransCanada could not demonstrate that the crude oil it carries in the Keystone Pipeline did not constitute sour service (as defined by CSA Z662-11), since it had not conducted any testing to verify the partial pressure of the H_2S at the bubble point absolute pressure.

Subsequently, in April 2013, TransCanada committed to implement a sampling program to verify the H_2S content of all the products it carries on the Keystone Pipeline. In June 2013, TransCanada indicated that it had tested all of its regularly shipped commodities using the standard method Universal Oil Products (UOP) 163-10, which is a potentiometric titration method, to verify the H_2S content of the crude oil. All of the commodity tests produced a modeled partial H_2S pressure less than 0.3 kPa and therefore confirmed the non-sour nature of these products. TransCanada's report stated that given the conservative nature of the test, additional testing of these products is not intended at this time.

Based on the fact that TransCanada has not monitored the H_2S content of the different batches of products it carries on the Keystone Pipeline, and based on the fact that TransCanada's planned practice is not to monitor the H_2S content of the different batches of products it carries, or will carry in the future, on the Keystone Pipeline, TransCanada is not in compliance with the requirements of this audit sub-element and CSA Z662-11, Clause 3.2.

Monitoring of Corrosion on Un-Piggable Pipelines

TransCanada's documentation indicated that the risk assessment and risk management of the external corrosion threat are achieved using either of the following two approaches:

1. For pipelines where an in-line inspection (ILI) has been completed, the specific anomalies are assessed, and control or mitigation activities are planned based on a defect management approach.
2. For pipelines where ILI has not been completed, risk mitigation activities are determined based on TransCanada's risk assessment results (PRIME), subject matter expertise, and applied learnings from other similar segments of pipe across the TransCanada system, including historical performance.

In terms of the NOVA Gas Transmission Ltd. (NGTL) system, it is mostly un-piggable (approximately 25% of the NGTL system has been in-line inspected). TransCanada's 2013 results from PRIME for the NGTL System indicated that 234 pipeline segments exceeded TransCanada's stated risk tolerance. The PRIME technical documentation, Section 4, Consequence Models, contains TransCanada's Societal Risk Acceptance Curve (FN). The Unacceptable Region of the FN curve is where the Societal Risk does not meet TransCanada's Individual or Societal Risk criteria and these segments are prioritized for risk-reduction activities in the current year's program.

For NGTL's un-piggable segments, mitigation programs should normally be applied to reduce the risk to an acceptable level. Documentation submitted by TransCanada indicated that not all of the pipeline segments in the NGTL system exceeding TransCanada's risk tolerance had mitigation plans for 2013. According to documents reviewed, 160 of the 234 pipeline segments of the NGTL system exceeding TransCanada's risk tolerances and had no mitigation plans for 2013.

During the audit, TransCanada was asked to justify the absence of mitigation plans for these 160 pipeline segments. In response, TransCanada provided modified risk assessment results indicating that these segments were now acceptable to TransCanada's risk criteria. TransCanada explained that its modified risk assessment process includes information gathered after inspecting (ILI or direct examination) nearby pipelines in similar condition. The nearby pipeline conditions are now factored in the probability component of the risk assessment, with the result being that all but one of the 160 pipeline segments had acceptable risk results. TransCanada indicated that there are no further mitigation plans for any of the 160 segments, except for the one segment that still exceeded TransCanada's risk tolerance with the new risk assessment process and for which TransCanada had added a mitigation plan for 2013.

TransCanada did not provide evidence proving the validity of its new risk assessment methodology of using nearby or parallel pipeline information as an adequate way to monitor the integrity of its pipeline segments. The Board notes that this methodology is not an industry recognized method for determining the integrity of a pipeline, as opposed to recognized methods such as ILI, hydrotesting or the NACE External Corrosion Direct Assessment (ECDA) Process. Whether corrosion occurs or not, or is severe or not corrosive, is specific to the local conditions of the pipeline and the pipeline's interaction with its surrounding environment. Several factors such as manufacturing process, construction practices, cathodic protection (CP) levels, soil type and composition, moisture levels, mechanical damage (1^{st}, 2^{nd}, 3^{rd} parties or pipe/soil movements) could affect the condition of the pipe coating, all of which could affect the susceptibility of the segments to external corrosion. Nearby pipeline conditions can give an indication of the potential corrosivity of an area and conditions of a pipeline, but it is not

information that can be relied on to effectively demonstrate the integrity of a pipeline. As such, the Board is of the opinion that nearby or parallel pipeline information cannot be used directly in the risk assessment process.

TransCanada's monitoring programs for external corrosion on these un-piggable pipeline segments is limited to the *Corrosion Control Surveys* section covered later in this section. While these programs are common industry practices, monitoring CP systems alone is not a recognized practice for thoroughly assessing the effectiveness of the CP system, which is typically done with pipe-to-soil close interval surveys. Also, for pipelines coated with shielding coatings such as PE Tape, which is the coating on many of TransCanada's un-piggable segments, CP can be ineffective at preventing corrosion under a disbonded coating condition.

Relying on nearby or parallel pipeline information and CP monitoring as described in the *Corrosion Control Surveys* section below is not an adequate monitoring method of the external corrosion threat of the un-piggable or non-hydrotested pipelines on the NGTL system. Therefore, TransCanada is assessed to be in non-compliance with this audit element and CSA Z662-11, Clause 3.2.

Overall, the NGTL un-piggable pipeline systems have been characterized by TransCanada as follows:

- For small diameter pipelines (<20"):
    - Low societal and environmental consequence;
    - Probable failure mechanism is leak versus rupture;
    - Low probability of ignition; and
    - Approximately 56% FBE or extruded polyethylene.

- For large diameter pipelines (>20"):
    - Low societal and environmental consequence;
    - Probable failure mechanism is leak versus rupture;
    - Low probability of ignition;
    - Approximately 89% FBE or extruded polyethylene; and
    - Low performance coated (Ptape) pipes have been 75%-88% hydrotested.

In terms of its current activities and forward plans to address un-piggable pipelines, the Board notes that TransCanada has provided the following information:

- Installation of 5 sets of launchers and receivers on the Canadian mainline in 2013;
- Completion of CP close interval surveys on un-piggable segments in TQM in 2012 and subsequent ILI and investigative dig inspections in 2013;

- Scheduling of 2 ILI runs and 15 investigative digs on the Foothills System in 2013;
- Scheduling 21 sets of launchers and receivers and 7 tethered ILI runs for the Alberta System in 2013;
- Inclusion in the 2014 – 2017 budgets plans to install 8 to 10 sets of new launchers and receivers per year in its un-piggable pipeline systems;
- Scheduling direct assessment, ILI or hydrotests within the next 7 years for 58 segments that have high consequence, but have high performance coatings;
- Scheduling direct assessment, ILI or hydrotests within the next 5 years for 19 segments that are have consequence, but have low performance coatings;
- Scheduling ILI by prioritization of 35 segments that have polyethylene tape (Ptape) coatings and pipe diameters greater than 12"; and
- Scheduling ILI in 2013/2014 of 8 segments that have high societal risk.

Corrosion Control Surveys

During the audit, TransCanada's information indicated that the TransCanada Pipe Integrity group is responsible for managing and administering the corrosion control programs for pipeline, pump station and terminal facilities. CP readings are performed by Regional field personnel either at site or via remote monitoring. The requirement for corrosion control monitoring, as outlined in CSA Z662-11, Clause 9, is detailed in TransCanada Operating Procedures (TOPs) Cathodic Protection Rectifier Inspection (EDMS No. 004258831), Cathodic Protection Survey Inspection (EDMS No. 004258833), and Cathodic Protection Rectifier and Bond Reading Inspection (EDMS No. 004258832).

To ensure the proper operation of its CP system, TransCanada inspects all impressed current facilities twelve times in a calendar year, not to exceed an interval of 6 weeks. Annual rectifier inspections are conducted, which involves reading AC inputs, calculating rectifier efficiency, conducting visual inspections and performing maintenance cleaning. Test lead surveys are performed annually to ensure all facilities are receiving adequate cathodic protection levels. In addition to monitoring CP facilities, CP isolation surveys are also undertaken on an annual basis to ensure the applicable facilities are not interfering with the normal operation of the CP system.

When in-line inspection (ILI) data is unavailable, or to further monitor areas of potential concern, close interval surveys (CIS) are used to investigate performance of the cathodic protection system and to assess for external corrosion concerns. CIS surveys augment the annual test lead surveys by investigating CP protection levels between test leads. The requirement for these surveys is based on an engineering evaluation of the area in question. The criteria used to prioritize CIS requirements include previous CP history, Magnetic Flux Leakage (MFL) ILI

results, type of coating, stress corrosion cracking (SCC) and corrosion risk assessment results. TransCanada's corrosion control survey methodology with respect to CP is assessed as compliant with the requirements of this audit sub-element.

Aerial Patrols, Aerial Leak Detection and Ground Based Leak Detection

Regulatory Requirements for Pipeline Patrols

CSA Z662-11, Clause 10.6.1.1 states that "*Operating companies shall periodically patrol their pipelines in order to observe conditions and activities on and adjacent to their rights-of-way that can affect the safety and operation of the pipelines. Particular attention shall be given to the following:*

a) construction activity;
b) dredging operations;
c) erosion; ice effects;
d) scour;
e) seismic activity;
f) soil slides;
g) subsidence;
h) loss of cover; and
i) evidence of leaks."

CSA Z662-11, Clause 10.6.1.2 states "*The frequency of pipeline patrolling shall be determined by considering such factors as*

a) operating pressure activity;
b) pipeline size;
c) population density;
d) service fluid;
e) terrain;
f) weather; and
g) agricultural and other land use".

The OPR-99, section 39 states that "*A company shall develop a surveillance and monitoring program for the protection of the pipeline, the public and the environment."* Section 53(1) of the OPR-99 states that *"A company shall conduct inspections on a regular basis".*

In the Unites States, the US Department of Transportation Pipeline and Hazardous Materials Safety Administration (PHMSA) sets out the pipeline patrol requirements in the Code of Federal Regulations (CFR), Part 192 – Transportation of Natural and Other Gas by Pipeline: Minimum

Federal Safety Standards (49 CFR 192) in section 192.705 and Part 195 – Transportation of Hazardous Liquids by Pipeline (49 CFR 195) in section 195.412. The United States regulations are mentioned because TransCanada has developed its pipeline patrol program to meet the most prescriptive requirements, which in terms of ROW patrol frequencies, are those set out in the 49 CFR 192 and 195.

During the audit, TransCanada indicated that it implements its pipeline patrols to meet at in accordance with the requirements of CSA Z662-11, Clause 10.6.1.1 Pipeline Patrolling. Aerial patrols are completed to look for construction activity, vegetation, signage, erosion, geotechnical concerns, encroachments, leaks, and water crossings. Patrol frequencies are outlined in the TOPs Aerial Pipeline Patrol (EDMS No. 003672387) and Pipeline Ground Based Patrols (EDMS No. 003875137). All natural gas pipelines are to be patrolled a minimum of two times per year. Liquid pipelines are to be patrolled 26 times per year. Additional patrols are to be completed at increased frequencies as warranted, based on a review of historic observations, levels of activity along the ROW, known integrity concerns, or as may be directed by the applicable regulator. Aerial patrols are to be executed with the use of helicopter or fixed wing aircraft as per the aircraft operating company assigned to complete the patrol. Aerial leak detection for natural gas pipeline systems is a component of the overall leak detection strategy, as are observations from landowners, contractors and employees working near the pipeline. Aerial leak detection is to be performed at least annually on natural gas pipeline systems, as described in Pipe Integrity Leak Detection and Evaluation (TEP-LEAK-INT, EDMS No. 007379105). Aerial leak detection on gas pipeline systems is to be performed with the use of helicopters. Supplemental ground based leak patrols are to be initiated as per the TOP Pipeline Ground Based Patrols (EDMS No. 003875137) either when aerial patrol frequency does not meet the minimum regulatory requirements, or where anomalies identified during aerial leak detection require ground based confirmation.

Both the TransCanada's TOP Aerial Pipeline Patrol (EDMS No. 003672387), Section 4.2 - Frequency and the TOP Pipeline Ground Based Patrols (EDMS No. 003875137), Section 3.0 – Frequency, address the patrol frequency requirements based on, for example, class location, highway and railroad crossings, levels of activity, integrity concerns and pipeline commodity. While CSA Z662-11, Clause 10.6.1.1 uses the term "periodically" and the OPR-99, section 39 remains silent on the patrol frequency, TransCanada's patrol frequencies are assessed to be in compliance with the intent of the standard and the regulation with respect to pipeline patrol frequency.

TransCanada's Aerial and Ground Patrol TOPs, sections 4.4 - ROW Monitoring and 4.6 - Reporting in the former and section 4.1 -Pipeline Ground Based Patrols in the latter, address the

pipeline patrol requirements for monitoring and reporting conditions and activities as required by CSA Z662-11, Clauses 10.6.1.1 and 10.6.1.2. The Board examined a random aerial patrol record requested for an incident (OB9_Aerial Patrol Reported_DOC_IIT#233782) related to a sink hole at 10-27-34-5W4 (Keystone Pipeline ROW) reported 23 April 2012 and noted that the record met the requirements for monitoring and reporting. TransCanada's pipeline patrol TOPs have been developed to address the most stringent, prescriptive pipeline patrol requirements and have been assessed to be in compliance with the standard and regulation.

Facilities Integrity Inspections

During the audit, TransCanada indicated that its Facilities Integrity Inspections procedure (EDMS No. 003857228) for gas transmission facilities and Keystone Facilities Integrity Inspections procedure (EDMS No. 006787339) for liquid facilities are designed to ensure that critical equipment is functioning as intended. Mechanical, electrical, civil and environmental components are to be inspected at intervals as described in these documents.

At liquid facilities, the Keystone Facility Piping Non Destructive Inspection (EDMS No. 006790574) Task Package is used. The purpose of this Non Destructive inspection package is to determine the condition of pressure piping and associated fittings, including the coating and insulation, and is designed to ensure fitness for service and proactively identify applicable maintenance requirements. TransCanada was assessed to be in compliance for its inspection program of its liquid facilities.

As described in the following evaluation of TransCanada's inspection program for high pressure station piping for its gas facilities, TransCanada's previous facility pipe integrity program was managed under the Integrity Management Process for Pipelines (EDMS No. 003892900). Chapter 7 of this document, Facility Pipe Integrity, contained sections which described, in general terms, the background descriptions for;

- corrosion control (section 7.1.1);
- overpressure protection (section 7.1.2);
- mechanical damage (section 7.1.3);
- operating/maintenance procedures (section 7.1.4);
- employee/contractor training (section 7.1.5);
- localized attack mechanisms (section 7.2);
- soil-to-air interface (section 7.2.1);
- contact corrosion (section 7.2.2);
- corrosion under insulation (section 7.2.3); and
- erosion and corrosion/erosion (section 7.2.4).

The Board is of the view that these generic background descriptions do not provide the level of specificity required for the implementation of an adequate and effective gas facility pipe inspection program. Therefore, as the following evaluation has concluded, TransCanada's gas facility inspection program is not in compliance with the requirements of this audit element and with CSA Z662-11, Clause 3.2.

High Pressure Station Piping (Gas Facilities)

The audit identified that TransCanada utilizes different methods to monitor its facility piping integrity. The methods include regular site visits, annual CP surveys, visual inspection, and preventative maintenance activities such as valve and valve operator inspections. Visual inspection is performed at facilities during planned facility inspections, facility pipeline projects, and regular site visits. Hazardous or abnormal conditions, such as leaks or frost heaved piping, are to be checked for during site visits. Issues identified are to be communicated through the company Incident and Issue Tracking (IIT) system for follow-up. In regions where atmospheric corrosion is more of a concern due to a more humid environment, such as the Eastern region, a riser assessment program was recently implemented to assess external corrosion on the risers at the air-to-soil interfaces and other locations where atmospheric corrosion also could be present, such as between supports the piping. As part of the audit verification process, NEB staff conducted an inspection on 6 June 2013 of the riser assessment program in Quebec that demonstrated the implementation of this program and no non-compliances were identified during the inspection.

TransCanada indicated that only a limited number of excavations with the primary purpose of performing a direct examination of the integrity of the station piping have been done so far, but that some opportunistic excavations (due to maintenance or modifications for example) have been used to assess the condition of the buried station piping at some locations. TransCanada provided records of these opportunistic facility piping inspections, which included:

- Field Lake Compressor Station (NGTL) for external corrosion, 7 May 2011;
- Mainline Rideau Riser Assessment and Recoat Project for atmospheric corrosion, September 2012;
- Mainline Quebec Riser Assessment and Recoat Project for atmospheric corrosion, September 2012;
- TQM Riser Assessment and Recoat Project for atmospheric corrosion, September 2012;
- Mainline Maple and Niagara Riser Assessment and Recoat Project, September 2012; and
- Torrington Compressor Station / Storage Facility for external corrosion, September 2012.

TransCanada stated that it has assessed the risk of external corrosion as being low for its station piping, taking into consideration the fact that the station piping is operating at a lower stress level than the main line pipe, that there are no unresolved CP issues at its stations, and because it has never had a rupture and was not aware of any leak on the pipe body at any of its stations.

As previously described, TransCanada's station piping was managed under the *Integrity Management Process for Pipelines - Revision 2* process. Review of Sections 7.3 and 7.4 of this process indicates that the integrity monitoring program was focused on the above ground piping and limited to CP monitoring, leak surveys and opportunistic excavations for standard monitoring of the below ground piping. Review of these sections also indicated that only if issues with CP or external corrosion were identified would inspection techniques such as ILI, direct assessment or leak testing be used. Therefore, a proactive or adequate monitoring program was not in place for the integrity of the station piping prior to the new Facility Pipe Threat Management Program, which was approved by TransCanada management for use in December 2012, has not yet been fully implemented throughout TransCanada's gas facilities.

The audit identified that, at the time of the audit activities, TransCanada has not conducted adequate direct assessments, hydrotests or ILI programs to assess the potential for external corrosion of its below-ground station piping. With the exception of the riser assessment program in the Eastern region, where the station risers are exposed for approximately 50 cm, there has not been a formal system-wide assessment for potential external corrosion of its below-ground or air-to-soil interface station piping. Where there is no riser program in place, the integrity monitoring for the below-ground or air-to-soil interface station piping is limited to CP pipe-to-soil potential and rectifier monitoring and a limited number of opportunistic excavations.

Although TransCanada stated that, to its knowledge, it has not yet identified any external corrosion issues on its below-ground station piping, the methods used by TransCanada are not adequate to demonstrate the appropriate integrity management of the station piping and TransCanada is therefore determined to be non-compliant with the requirements of this audit element and with CSA Z662-11, Clause 3.2.

Tank Inspections

TransCanada operates oil storage tanks as part of its Keystone Pipeline system at Hardisty, Alberta. Storage tanks are to be inspected as per CSA Z662-11, Clause 10.9, Operation and Maintenance of Facilities and Equipment. Specifically, CSA Z662-11, Clause 10.9.2, Aboveground Tanks and Pressure Vessels and sub-clause 10.9.2.1 states that "*the inspection,*

repair, alteration, and reconstruction of aboveground atmospheric steel tanks shall be as specified in API 653".

API 653, Tank Inspection, Repair, Alteration and Reconstruction, Section 4 – Inspection, details the requirements for internal and external inspections as well as for the requirement that the inspections be carried out by an Authorized Inspector. Intervals are specified in Sections 4.2.2 for external inspection and 4.4.2 for internal inspection. Section 4.4.3 provides for an alternative to the procedures in 4.4.2 where an owner-operator may establish the internal inspection interval using a risk-based inspection (RBI) procedure.

TransCanada has developed the TOP API 653 Aboveground Storage Tank Inspections (EDMS No. 007167240) for inspection of its aboveground storage tanks. Section 3.0 Frequency, of this procedure specifies the standard inspection intervals (expressed as months, for example M12 is every 12 months) as follows:

- Routine In-service Inspections: M01;
- Internal/External Floating Roof Tanks Secondary Seal Inspection: M12;
- External Visual Inspection: M60 (Adjust inspection interval based on the condition of the Tank);
- External Ultrasonic Thickness Inspection: M60;
- Internal/External Floating Roof Tank Primary Seal Inspection: M60; and
- Internal Inspection M120.

Section 4.0 Procedures, details the requirements for the following:

- routine in-service inspections;
- internal floating roof tanks secondary seal inspection;
- external floating roof tanks secondary seal inspection;
- external visual inspection;
- external ultrasonic thickness inspection;
- internal/external floating roof tank primary seal inspection;
- internal inspection;
- inspection locations; and
- documentation / reporting requirements.

TransCanada requires that its inspectors are certified to API 653 (i.e. Authorized Inspectors) and that the inspection reports are reviewed by TransCanada engineers who are competent in aboveground storage tank design, operation and maintenance. TransCanada provided records of aboveground storage tank inspections at the Hardisty terminal indicating that the frequency and extent of inspections met the requirements of API 653. TransCanada also provided records of its

aboveground storage tank inspector qualifications which included API 653 certified storage tank inspector.

The Board has determined that TransCanada's procedures for inspection of its aboveground storage tanks are in compliance with the requirements of CSA Z662-11 and API 653.

TransCanada's facilities also have underground tanks, commonly referred to as "drip tanks". CSA Z662-11, Clause 10.9.3 Underground Storage and specifically Clause 10.9.3.1 states "*underground tanks shall be inspected periodically and maintained as necessary. The inspection program shall include the periodic monitoring of any leak detection systems*".

TransCanada has developed two TOPs for underground drip tank inspections: Underground Drip Tank Inspection (EDMS No. 003719673) and Underground Drip Tank Inspection Task Package (EDMS No. 003719218) to comply with CSA Z662-11, Clause 10.9.3. The Underground Drip Tank Inspection procedure, Section 3.0 – Frequency, prescribes a frequency of M36 (36 month inspection interval) for its drip tank inspections. TransCanada provided a list of stations containing underground drip tanks that are to be included in its M36 inspection procedure and samples of records of past underground drip tank inspections.

The Board has determined that TransCanada's procedure for inspection of its underground drip tanks is in compliance with the requirements of CSA Z662-11, Clause 10.9.3.1.

Boiler and Pressure Vessel Inspections

During the audit, TransCanada indicated that its boiler and pressure vessel inspections are carried out in accordance with the Quality Assurance Manual (QAM) for the Integrity Management of Pressure Equipment Including Repairs and Alterations (EDMS No. 003722000). This procedure is based on the API 510 Pressure Vessel Inspection Code, Alberta inspection standards and industry practice. The inspection of pressure vessels follows the TOP Pressure Vessel External and Internal Inspection (EDMS No. 003694710), under the direction of TransCanada's Chief Inspector for pressure equipment. Pressure vessel inspections are documented and the vessels are certified for continued service by the Chief Inspector. The Pressure Vessel Integrity Plan (EDMS No. 003763099) is reviewed periodically by Facilities Engineering to review risks and to direct future inspection programs. Heating boiler inspections are carried out in accordance with Part 5 of the Canada Occupational Health and Safety Regulations by the provincial jurisdictional authority or by an insurance company authorized by the provincial jurisdictional authority. Occasionally in Alberta (only), heating boiler inspections are carried out by the Chief Inspector, as authorized by the provincial jurisdictional authority.

TransCanada provided a sample of the qualification records for its Chief Inspectors, who are employees of TransCanada, which included:

- ABSA In-Service Boiler and Pressure Vessel Inspector;
- National Board Commissioned Inspector;
- API 510 Pressure Vessel Inspector;
- API 570 Pressure Piping Inspector;
- API 653 Storage Tank Inspector;
- API 580 Risk-Based Inspection;
- ABSA Welding Examiner;
- CSA W47.1/CWB Welding Supervisor;
- IIW International Welding Engineer; and
- CSA W178.2/CWB Welding Inspector Level 3.

Additionally, the Chief Inspector qualifications included membership in the following:

- Professional Engineer of APEGA
- Technical Committee Member of CSA B51 Boiler, Pressure Vessel and Piping Code
- Member of Upstream Chief Inspector Association
- Member of American Society of Non-destructive Testing

TransCanada's QAM applies to approximately 2500 vessels and boilers registered in the province of Alberta in a quality management system registered with ABSA, the Pressure Equipment Safety Authority in Alberta. Section 11 of the QAM specifies the inspection intervals for pressure equipment, including pressure vessels, boilers, pressure relief valves based on the requirements of API 510 and API 572 (pressure vessels), API 570 (pressure piping), API 574 (piping system components) and API 576 (pressure relieving devices) as well as the inspection requirements of the National Board Inspection Code (NB23) and ABSA's Inspection and Servicing Requirements for In-Service Pressure Equipment (ABSA AB-506).

At the Board's request, TransCanada provided samples of inspection records for its pressure equipment; a 2012 internal audit of its QAM; a 2011 audit by ABSA of TransCanada's Pressure Equipment Integrity Management System; a 2011 internal audit report at CrossAlta Gas Storage Facility for the Owner-User Pressure Equipment Integrity Management System; and a 2010 internal audit for the QAM Owner-User Program for the Integrity Management of Pressure Equipment Including Repairs and Alterations.

The Board has determined that TransCanada's procedures for inspection of its pressure equipment are in compliance with the requirements of the applicable codes and standards.

Geotechnical Monitoring

Regulatory Requirements for Geotechnical Monitoring

CSA Z662 clause 10.6.1.1(f), (g) and (h) address the requirements for pipeline monitoring for geotechnical issues. This clause states that "*Operating companies shall periodically patrol their pipelines in order to observe conditions and activities on and adjacent to their rights-of-way that can affect the safety and operation of the pipelines. Particular attention shall be given to the following:*

f) seismic activity;
g) soil slides; and
h) subsidence".

In terms of the required frequency of the pipeline monitoring activities, CSA Z662-11, Clause 10.6.1.2 states "*The frequency of pipeline patrolling shall be determined by considering such factors as*

a) operating pressure activity;
b) pipeline size;
c) population density;
d) service fluid;
e) terrain;
f) weather; and
g) *agricultural and other land use"*.

The OPR-99, section 39 states that "*A company shall develop a surveillance and monitoring program for the protection of the pipeline, the public and the environment.*" Section 53(1) of the OPR-99 states that "*A company shall conduct inspections on a regular basis*".

Based on audit interviews and documents reviewed, the Board noted that geotechnical hazards, such as susceptible landslide locations, are identified in a Phase 1 Geo-Hazards Assessment, as described in the Weather and Outside Forces (WOF) Threat Management Program (TEP-ITM-WOF, EDMS No. 005767611). As per Section 5, Roles, Responsibilities and Qualifications of the WOF procedure, higher risk sites are further assessed by TransCanada senior geotechnical engineers (E4-5 classification and evidenced by records requested during the audit and provided by TransCanada). Appropriate actions (e.g., regular inspection and monitoring, slope remediation) are taken based on the results of the assessment. Geotechnical and river crossing monitoring activities are supplemented by TransCanada's Aerial Pipeline Patrol program and by field personnel observations. TransCanada's IIT system is used to track issues related to geotechnical remediation and monitoring programs for follow-up and resolution.

TransCanada's Weather and Outside Forces Threat Management Program (WOF) (TEP-ITM-WOF, EDMS No. 005767611), contains Section 6 Background, which describes the threat types that are to be evaluated during the execution of the geotechnical monitoring program. These include:

- 6.1.1 Landslides;
- 6.1.2 Seismic events;
- 6.1.3 Fault planes;
- 6.1.4 Subsidence and heave;
- 6.1.5 Water flow; and
- 6.1.6 Meteorological events.

Appendix A of TransCanada's WOF provides a Geological Hazards Classification Summary for the above threats, with quantitative descriptions of the threat classifications of low, medium and high. The threat classifications guide the risk assessment process and subsequent remediation, mitigation and monitoring programs as per the WOF Management Procedure illustrated in Figure 7-1 of the WOF TEP and the procedural steps detailed in Section 8 of the WOF.

During the audit interviews, TransCanada stated that it has performed a Phase 1 survey for all of its pipeline systems. At the Board's request, TransCanada provided samples of the following documents and records of its Phase I Geo-Hazards Assessments:

- Phase I Implementation of Rainfall Ground Movement Models (September 1999);
- Visual Inspection of Slopes: Summary of Observations for 11 Slopes in Northern Alberta (11 October 2001);
- Unnamed Creek Cranberry Lake Lateral Geotechnical Instrumentation Installation Report (20 January 2003);
- Pembina River Slope Stability (20 October 2001); and
- Keystone Canada Phase I Geohazard Assessment (2010).

The Board also requested that TransCanada provide examples of its Phase II and Phase III surveys. TransCanada provided an example of the TQM Phase I, followed by a Phase II survey for TQM and well as examples of Phase III surveys with the following descriptions:

> "Cranberry Lake Lateral, Unnamed Creek SW-22-85-20-W5 site was identified in the 1999 Phase 1 report as having a medium potential for ground movement. A subsequent Phase II study was completed in 2001, and findings documented in a 2001 report titled "Summary of Observations for 11 Slopes in Northern Alberta". In order to mitigate the risk to the pipeline, a Phase III investigation, which resulted in the installation of slope monitoring equipment, was completed in 2003".

> "Edson Mainline, Pembina River SW-28-48-15-5 site was identified in the 1999 Phase I report as having a high potential for ground movement. A subsequent Phase II study was completed in May 2000 to assess the site conditions. The findings were documented in a technical memorandum titled "Assessment of Slope Movement Potential, Site Visit Report". The Phase III assessment, which included a ground survey, was completed in 2001".

During the audit, it was observed that TransCanada's WOF program did identify areas of geological sensitivity, but this information did not appear to influence the scope and/or frequency of the geological hazard patrol program. TransCanada responded to this audit observation by stating that "TransCanada determines the scope and typical frequency of ROW patrol based on class locations, history of the lines, and other factors. Additional patrols are initiated in response to unforeseen geotechnical and meteorological events. TEP-ITM-WOF Section 8.4 Step 35 specifies that an aerial or ground survey shall be performed when investigating significant meteorological events; Section 8.4 Step 27 specifies that an aerial or ground survey shall be performed to investigate areas where earthquake magnitudes exceed 0.2 g peak ground acceleration. Identifying geotechnical threats is a part of the ROW patrol, but usually not a main factor that dictates the frequency of the patrol, because geotechnical threats, once identified, are dealt with separately in its own systematic way. Once an area of geological sensitivity is identified and verified through ground investigation, we install monitoring equipment and perform regular ground inspections. There are sites of active ground movement (Simonette River crossing for instance) where we have inspection and monitoring up to three times a year, in addition to regular aerial ROW patrol. Our experience so far has demonstrated that the regular scheduled aerial patrols supplemented by additional ground inspections/monitoring at sensitive areas have been effective in identifying WOF related hazards before they become threats to the integrity of our pipelines."

The Board has determined that TransCanada's program for geotechnical monitoring is in compliance with the requirements of CSA Z662 clause 10.6.1.1(f), (g) and (h), clause 10.6.1.2 and the OPR-99 sections 39 and 53(1).

Water Crossing Surveys

Regulatory Requirements for Water Crossing Surveys

CSA Z662-11, Clauses 10.6.4.1 and 10.6.4.2 detail the requirements for pipeline crossings of water bodies.

Clause 10.6.4.1: "*Special consideration shall be given to the inspection and maintenance of pipeline crossings of (a) major utilities; (b) other pipelines; (c) railways; (d) roads; and (e) water"*.

Clause 10.6.4.2: "*Underwater crossings shall be inspected periodically for adequacy of cover, accumulation of debris, and other conditions that can affect the safety or integrity of the crossing*".

TransCanada's pipeline systems have numerous water crossings that require inspection and monitoring programs. During the audit interviews, TransCanada indicated that periodic inspections are conducted at stream crossing locations of concern for adequacy of cover, accumulation of debris, and other conditions that may affect the safety or integrity of the crossing. Underwater depth of cover surveys are performed at selected stream crossing locations based on size of stream bed, visibility during aerial patrols, results of previous surveys, potential for mechanical damage, and severity of identified consequences. Minimum stream crossing cover specifications and stream crossing survey procedures are found in the TOP Pipeline Underwater Inspections (EDMS No. 003671756).

During the audit interviews, the Board noted that TransCanada's geological hazards classification summary refers to geotechnical threats and erosion threats, but the WOF program does not cover soil erosion and/or flooding threats. The Board requested that TransCanada address this concern. TransCanada's response was as follows:

"The Geological Hazards Classification Summary in the TQM Phase I Geo-hazard Assessment reports refers to slope stability and erosion as two main geotechnical threats that could impact pipelines on the TQM system. They are addressed in the *TEP-ITM-WOF Weather and Outside Forces Management Program* somewhat differently due to nature of the threats with respect to integrity. Slope stability impacts pipe integrity in a direct way, so actions dealing with slope movement are clearly defined in the TEP. Soil erosion itself is not an integrity threat, until it leads to pipe exposure. As such, TransCanada does not address soil erosion in the TEP-ITM-WOF. Rather the procedures in dealing with pipe exposure are outlined and documented in Steps 40 to 49 (page 20 to 22) of the TEP-ITM-WOF.

The document, TEP-ITM-WOF Weather and Outside Forces Management Program contains the following references to flooding:

1) The definition of a "weather and outside force integrity event", (page 9), defines floods as among the events that may impact the integrity of the pipeline.
2) Section 6.1.5 describes water flow events, including floods that could lead to pipe exposures and therefore increase the potential for mechanical damage.

3) Section 8.2, step 8 instructs the reader to identify areas of exposed pipe or having the potential to become exposed. Flooding is directly mentioned in that step.
4) Section 8.4, steps 28 to 33 are applied "when investigating significant flooding.
5) Section 8.4 Step 35 instructs the reader to perform and aerial or ground survey when investigating significant meteorological events.

The potential threat of stream erosion, which could lead to pipe exposure, is managed through regular underwater survey in major stream crossings. The TEP-ITM-WOF Section 8.2, step 8 states "Identify exposed pipe locations and areas of potential exposure from underwater surveys. The underwater surveys are performed as described in TOP Pipeline Underwater Inspections, (EDMS 003671756). During the audit, the Board reviewed TransCanada's water crossing monitoring procedures and assessed them to be in compliance with the requirements.

Summary: Inspection, Measurement and Monitoring

The Management System Audit Element 4.1, Inspection, Measurement and Monitoring, requires a company to develop and implement surveillance and monitoring programs including contract work being performed on behalf of the company. These programs are expected to include measures for evaluating the management and protection programs.

Based on documents and records reviewed, the audit determined that TransCanada has developed and implemented a number of effective inspection, measurement and monitoring programs. This includes but is not limited to:

- Sediment and water monitoring and mitigation programs to prevent and reduce internal corrosion on the Keystone pipeline system;
- Conducting both aerial and ground-based pipeline patrols in accordance with CSA Z662-11 requirements with additional patrols as warranted or as directed by the regulator;
- Development of monitoring programs to evaluate specific geotechnical hazards in each operating region; and
- Regular inspection and monitoring of sensitive areas including river crossings and susceptible landslide locations.

Other sections of this sub-element were identified as non-complaint with regulatory requirements due to inadequate or incomplete program implementation. This included:

- TransCanada's position that ongoing monitoring of all shipped commodities for sour crude on the Keystone pipeline is not required since recent testing confirmed the current non-sour nature of these products;

- TransCanada's inability to produce sufficient evidence proving the adequacy of its ongoing integrity management programs for corrosion on unpiggable sections of the NGTL system; and
- background descriptions for the facility pipe inspection program that were too generic and did not provide the level of specificity required for adequate, effective and consistent implementation.

Management System Audit Element Finding: Based on the documents assessed and interviews with personnel as it relates to: monitoring of Hydrogen Sulfide (H_2S) in crude oil in the Keystone Pipeline; monitoring of external corrosion on the Alberta (NGTL) System's unpiggable pipelines; and the integrity monitoring of below-ground station piping on all of TransCanada's facilities, TransCanada is assessed to be non-compliant with the requirements of the OPR-99 and CSA Z662-11, and is therefore non-compliant with this audit sub-element.

Compliance Status: Non-Compliant

4.2 Corrective and Preventive Actions

Expectations: The company shall have a process to investigate incidents or any non-compliance that may occur. The company shall have a process to mitigate any potential or actual issues arising from such incidents or non-compliances. Such mitigation may include appropriate timing and actions for addressing the issues that arise. The company shall demonstrate that it has established a documented procedure to:

- set criteria for non-compliance;
- identify the occurrence of any non-compliances;
- investigate the cause(s) of any non-compliances;
- develop corrective and/or preventative actions; and
- effectively implement the required corrective and/or preventative actions.

The company shall develop procedures to analyze incident data in order to identify deficiencies and opportunities for improvement in its management and protection programs and procedures.

References:

OPR-99 sections 4, 6 and 52
CSA Z662-11, Clauses 3.1.2(g) and 3.1.2(h)(i), 3.2, 10.3.6, 10.4.4 and 10.5

Audit Assessment:

Incident Management System

During interviews and in documents submitted, TransCanada indicated that it has an Incident Management System (InMS), which is a set of management tools and processes used to investigate incidents or any non-compliance. Within the InMS, TransCanada has the Incident and Issue Management Program (InMP), which utilizes the following tools:

- An Incident and Issue Tracking (IIT) system, which is an electronic database tool used to report and track the investigation of an incident, a near-hit or an identified non-compliance. The criteria for incidents, near-hits and non-compliances are listed on the company's IIT incident summary sheet.
- A Classification Guide, which is a document defining the incident and issue event types reportable in the IIT system. These are a detailed breakdown of the event types into four levels of severity (Minor, Serious, Major and Critical).
- An InMP website, which is the TransCanada internal website that provides reference material, investigation templates, documentation, and manual forms.

TransCanada's Incident Management System, with its criteria for incident classification and investigation were assessed to be in compliance with the requirements of CSA Z662-11, Clause 10.3.6, Pipeline system incident investigations.

Issue Management Program

TransCanada provided information on the six main steps in its InMP, as follows:

1. Response: All TransCanada employees and its contractors are expected to participate in the InMP. They are responsible for recognizing that an incident or issue has occurred and for alerting the appropriate personnel in the event of an incident occurrence.
2. Notification: Once the response has taken place, an employee is to enter the incident into the IIT system, which is responsible for the notification of applicable personnel and regulatory agencies.
3. Investigation: All incidents and issues are to be reviewed. The level of rigor of investigation of each incident is dependent on the severity of the incident. Once investigation findings have been determined, appropriate corrective and preventive actions are to be identified and implemented to minimize or avoid future incidents.
4. Documentation and Implementation: Documented recommendations are updated into IIT and/or incorporated into TransCanada's Integrity Management Programs (IMPs), as appropriate.
5. Follow-up: Once the recommendations have been implemented, follow-up is to take place to ensure the recommendations were successful in addressing the incident or issue.
6. Sharing of Learnings: The final step of the InMP is to share the learnings with TransCanada's employees, contractors and external parties, with the goal of preventing a future undesirable consequence from occurring.

CSA Z662-11, Clause 3.1, Safety and Loss Management System, and specifically Clause 3.1.2 (h)(i) states *"The safety and loss management system shall include the following elements: (h) a continual improvement process, including performance monitoring for the ongoing assessment of conformance with the requirements of the safety and loss management system, and the mechanisms for taking corrective and preventive measures in the event of nonconformance"*. In addition, CSA Z662-11, Clause 10.3.6, Pipeline system incident investigations, states *"Operating companies shall investigate damage incidents related to external interference and failure incidents to determine their causes. Measures to prevent the occurrence of incidents due to similar causes shall be identified and implemented"*. TransCanada's procedures for incident management were assessed to be in compliance with the requirements, but as discussed under the topic of Incident Reporting, TransCanada's incident reports lack detail with respect to preventive

actions, follow-up and sharing of learnings. TransCanada has committed to working with the Board to improve the level of detail in its DIRs.

Incident and Issue Tracking (IIT)

During the course of this audit and in response to an Audit Information Request, TransCanada provided evidence of its analysis of six incident types:

- overpressure of pipelines and/or facilities piping;
- pump station leaks;
- other station releases;
- pipe body leaks and pipe body ruptures; and
- uninterruptable power supply (UPS) battery incidents.

The purpose of the interviews and document reviews relating to these incident types was to assess whether TransCanada had effectively implemented its IMS processes and procedures to identify the incident root cause(s), implement adequate and effective corrective and preventive action(s), and adequately and effectively followed its InMP processes and procedures for follow-up and sharing of learnings from the incidents, particularly for incidents related to TransCanada's IMPs. As discussed under the topic of Incident Reporting, TransCanada's incident reports lack detail with respect to preventive actions, follow-up and sharing of learnings. TransCanada has committed to working with the Board to improve the level of detail in its DIRs.

Integrity Threat Management Scorecards

TransCanada also submitted documents (Integrity Threat Management Scorecards) to demonstrate that it had compiled and analyzed key performance indicator (KPI) and incident data. The Scorecards submitted and reviewed were:

- Internal Corrosion;
- External Corrosion;
- Mechanical Damage;
- Construction Defects;
- Weather and Outside Forces;
- Manufacturing Defects;
- Equipment;
- Stress Corrosion Cracking (SCC);
- Leaks and Ruptures;

- Engineering and Asset Reliability IIT; and
- Customer Perfect Days.

In addition, TransCanada submitted the document "Gas Release-Leak (Canada) 2007-2012 Chart Q4r1.xls" that compiled the gas releases reportable to the Board from 2007 to 2012. TransCanada presented these figures as evidence of its process to analyze and trend incidents and their root causes. The document submitted contained histogram representations of the trends and/or causal factors relating to the gas releases as follows:

- Figure 1: Gas Leak and Release Trends;
- Figure 2: Gas Leak Breakdown, (Causal Factors);
- Figure 3: Electrical / Instrument / PLC Failures;
- Figure 4: Gaskets / Packing / O-ring / Etc.; and
- Figure 5: Piping / Tubing / Fittings.

TransCanada's Scorecards contained information on the individual threat management programs, including: goals and objectives; failure statistics (incident rates x 10^3 per km·yr) due to each threat; in-service leaks and ruptures; and histograms and pie charts of threat related data. The Scorecards were assessed to be in compliance with CSA Z662-11, Clause 10.3.6, Pipeline system incident investigations.

Non-Compliance Process

TransCanada stated that it has a systematic approach to addressing non-compliances. Non-compliances at the IMP level, and non-compliances with regulations and codes, are addressed and tracked through its IIT system. Corrective actions, including completion dates and follow-up, are assigned to specific individuals in the IIT system. The status of IIT incidents and issues, and action items, are reviewed by management monthly. In addition to day-to-day monitoring, non-conformances are identified through the following: audit findings (external and internal); process reviews, including TransCanada's Operating Procedures (TOPs); and incident investigations (failures, near-hits).

Pipelines (Oil and Gas)

For its pipeline systems (gas and liquids), TransCanada stated that corrective and preventive actions identified through internal audit findings are consolidated in an action log. The audit log lists identified actions to address the deficiencies, responsible individuals, completion dates and status. The status of corrective or preventative actions is included in the CDN-LIQ-IMP *Annual Review and Improvement Report*. Process Reviews of procedures are conducted annually, as described in the *Pipe Integrity Process Review Procedure*.

Facilities

For its facilities, TransCanada stated that corrective actions are also identified, investigated, evaluated and prioritized, based on the engineering discipline and equipment type, using other systems such as the TransCanada Operating Procedures (TOPs), Avantis (TransCanada's work management system) and health monitoring motor trending. Other tools, such as a Decision Support System (DSS), health monitoring, and pressure vessel and tank investigations, are used to complete trending analyses to determine if further actions are required for systemic issues and if these actions need to be tracked in a corrective log with monthly review by all stakeholders. Actions are then implemented in the General Plan Maintenance Capital (GPMC) program or the Preventive Maintenance (PM) program, which determines whether the risk is tolerated, terminated or transferred.

TransCanada stated that it ensures that corrective actions are implemented and followed up as part of the management review process. Management review includes monitoring the status of corrective and preventive actions in IIT monthly, and reviewing program performance measures to determine the effectiveness of the overall program.

Assessment of TransCanada's InMS and InMP determined that within its internal processes and procedures, TransCanada has demonstrated compliance with the requirements of this audit element for its facilities. As discussed in the following text, TransCanada's incident reporting, in the form of Detailed Incident Reports (DIRs) submitted to the Board, lacks detail with respect to preventive actions, follow-up and sharing of learnings.

Incident Reporting

In a meeting held 7 March 2013 to discuss TransCanada's DIRs, it was communicated to TransCanada that: the DIR corrective actions were assessed to be generally adequate; preventive actions tended to address local issues only; and incident follow-up and sharing of learnings were generally inadequate. TransCanada stated that the timeframe of submitting its DIRs to the Board and its internal incident investigation processes accounted for the discrepancies in the level of detail. That is, its DIRs are written and submitted more immediately following an incident, whereas its internal incident processes are generally conducted in detail some months later. To address the issue, TransCanada committed to working with the Board to improve the level of detail in its DIRs, and both the Board and TransCanada have committed to improving their communications with respect to TransCanada meeting the Board's expectations for incidents investigation and reporting.

Reporting of Non-Compliances

TransCanada was asked to provide its policies and procedures for the internal reporting of non-compliances. TransCanada stated that there are many available outlets for employees to bring concerns forward to TransCanada's management. These included the Incident and Issue Tracking (IIT) system; Ethics Help line; informal and formal reports to technical managers, non-conformance reports (NCRs); and the TransCanada Code of Business Ethics policy and procedures. TransCanada stated that employees are trained on these procedures during the onboarding process and through the annual employee Code of Business Ethics policy training and certification. TransCanada's internal Human Resources website provides employees with a list of the Compliance Coordinators for different areas of the company and a link to this document was, and continues to be, accessible to employees in the "Raise the Concern" section of the website. TransCanada stated that its management encourages open and honest discussion of all areas of concern and promotes an environment where safety is the paramount goal. TransCanada provided the following documentation to support its internal reporting of non-compliances:

- TransCanada Code of Business Ethics (TRP901-a77en);
- Code of Business Ethics Policy (EMDS No. 003721479);
- Ethics and Compliance (website printout);
- Ethics and Compliance organization (website printout);
- Ethics Help Line (website printout);
- List of Compliance Coordinators by Department (3 page document containing 12 coordinators for pipelines);
- Raising a Concern (website print out); and
- Frequently Asked Questions (website printout).

Summary: Corrective and Preventive Actions

The Management System Audit Element 4.2, Corrective and Preventive Actions, requires a company to have a process to investigate incidents or any non-compliance that may occur, including a process to mitigate any potential or actual impacts arising from the non-compliances. The company is also required to develop procedures to analyze incident data in order to identify deficiencies and opportunities for proactive improvement.

During the course of this audit, TransCanada provided evidence of its analysis of possible incident types. The company also demonstrated it had compiled and analyzed key performance indicator data in order to assess trends and establish root causes of incidents.

The Board noted that TransCanada's internal non-compliance and incident reporting processes were adequate but could be more detailed in the areas of preventative action and information sharing across the company. TransCanada has committed to improving the level of detail in these items.

Management System Audit Sub-Element Finding: Based on documents reviewed and interviews with personnel, TransCanada was able to demonstrate that it was in compliance with the requirements of the OPR-99 and CSA Z662-11, and is therefore compliant with the requirements of this audit sub-element.

Compliance Status: Compliant

4.3 Records Management

Expectations: The Company shall establish and implement procedures to ensure that the records supporting the management and protection programs are retained, accessible and maintained. The Company shall, as a minimum, retain all records for the minimum lengths of time as required by the applicable legislation, regulation and standards incorporated by reference into the regulation.

References:

OPR-99 sections 4, 41 and 56
CSA Z662-11 Clauses 3.1, 3.2, 9.11, 10.4 and 10.5

Audit Assessment

This Management System sub-element was not formally assessed during the Integrity Management Program audit.

Compliance Status: Not Assessed

4.4 Internal Audit

Expectations: The company shall develop and implement a documented process to undertake audits of its management and protection programs and procedures. The audit process should identify and manage the training and competency requirements for staff carrying out the audits. These audits shall be conducted on a regular basis.

OPR-99 sections 4, 53 and 55
CSA Z662-11, Clauses 3.1.2(c) and 3.1.2(h)(iii)

Audit Assessment:

General

During interviews and in documents submitted, TransCanada stated that the mandate of TransCanada's internal audit department (Internal Audit) is to act as an independent assessor, reporting on the company's system of internal controls, governance and risk management processes. Internal Audit reports functionally to the Audit Committee of the Board of Directors and administratively to the Chief Compliance Officer. Internal Audit is authorized to perform internal audits, including those involving Integrity Management Programs (IMPs). For TransCanada's IMPs, Internal Audit follows a maximum interval between audits of three years.

The following IMP documents state the requirements of TransCanada's internal audit program:

- Gas Pipeline IMP, Section 4.10;
- Liquid Pipeline IMP, Section 11.3.5; and
- Plant IMP, Section 2.5.2.

On a one to three-year basis, all procedural documents are reviewed for effectiveness by document owners and other shareholders. With respect to the IMPs, the engineering procedures are reviewed annually following the Pipe Integrity Process Review Procedure (TEP-INT-PR, EDMS No. 006522487). The effectiveness of the process and management system elements within each document is reviewed to identify non-compliances/non-conformances and/or areas requiring improvement.

Internal audits are conducted by TransCanada personnel that are independent of the areas to be audited, consistent with Annex N "Guidelines for pipeline system integrity management programs" of CSA Z662-11, specifically Clause N.15.4(d). In this respect, IMP audits are

completed by the Quality Management and Engineering Standards group or a third-party auditor. The Quality Manager is responsible for ensuring that employees are competent to complete internal office audits through documented skills, certifications, training or education. As a minimum, the Lead Auditor is qualified to the ISO Internal Auditor training, CSA Internal Auditor training or equivalent. The competency of third-party auditors is managed through the vendor qualification process, which includes requirements for documentation addressing the third-party auditor training and certification.

On a quarterly basis, TransCanada conducts field-based Targeted Compliance Audits that are performed at multiple locations within the Canadian Pipeline Operations Regions. The results are consolidated in a single report, which identifies systemic issues related to the topic assessed during the audit. Field-based audits are conducted by Canadian Pipeline Operations Compliance (CPO Compliance) team members comprised of a Senior Compliance Specialist and three Field Compliance Specialists. All team members attend internal training courses and receive certification from a training course conducted by an external third party. It is the responsibility of the CPO Compliance Manager to ensure employees are competent to complete field-based audits through documented skills, certifications, training or education. The process for completing audits is documented in TransCanada Operating Procedure (TOP) Compliance Assurance Program (EDMS No. 005364423) and the associated TOP Targeted Audit (EDMS No. 006281982).

The Quality Management and Engineering Standards internal audit processes and procedures requires the person accountable for the program that has been audited to resolve all findings. Audit findings are tracked in action logs or the Incident and Issue Tracking (IITs) database. Issues related to each audit are identified, and corrective and preventive actions, accountabilities, and timelines are recommended by the CPO Compliance audit team. Site-specific findings that are not considered to be systemic in nature are provided to the specific area manager to address. The finalized audit report is provided to the Vice President, Canadian Pipeline Operations, the regional leadership teams (Directors and Managers) and leaders of other departments who have been assigned specific actions to address identified deficiencies, and on whom the audit may have an impact. The Senior Compliance Specialist is responsible for monitoring the progress of audit resolutions and for escalating issues when deemed necessary. The status of completion of the actions is also tracked in the monthly CPO Compliance Scorecard, which is issued to and reviewed by the Vice President, Canadian Pipeline Operations, and the Directors.

NEB's Investigation of TransCanada's Response to a complainant's Allegations

TransCanada's Internal Audit Department conducted an audit of a complainant's allegations. The focus of the audit was as follows:

1. Independent Third Party Non-Destructive Examination
2. Independent Visual Surveillance of Welders
3. Non-Destructive Examination of Pressure Vessels
4. Qualification of Welders on the Keystone Pipeline
5. Practice of Engineering within TransCanada
6. Joining Pipe of Different Wall Thicknesses
7. Use of Automatic Ultrasonic Testing
8. Submission to the NEB of TransCanada's Joining Program
9. TransCanada's Formal Audit Program

The findings of TransCanada's internal audit and the resulting remediation measures taken by TransCanada were submitted to the Board on 18 July 2012. In addition, NEB audit interviews were held with TransCanada with respect to the resolution of a complainant's allegations on 18 March 2013. TransCanada was directed to provide additional information and supporting documents to substantiate the responses given during the interviews.

Each of the issues investigated in TransCanada's internal audit, as well as the NEB's assessment of the ongoing and completed remediation measures identified by TransCanada in response to the audit findings, are described below.

1. Independent Third Party Non-Destructive Examination

TransCanada's internal audit concluded that there had been instances where TransCanada did not ensure that qualified, third party non-destructive examination (NDE) vendors were hired under the direct supervision of TransCanada (and not by the pipeline, facility or fabrication contractor), resulting in a lack of independence. This was a non-compliance with the OPR-99, section 54(1), which states: *"When a company constructs a pipeline, the company or an agent independent of any construction contractor retained by the company shall inspect the construction to ensure that it meets the requirements of these Regulations and complies with the terms and conditions of any certificate or order issued by the Board."*

TransCanada's internal audit noted that a process was being implemented to ensure independent NDE inspections. During the NEB audit interviews, TransCanada confirmed that new processes were in place to ensure that NDE vendors were hired by TransCanada directly. NEB auditors requested that TransCanada demonstrate that it had a plan in place to examine past NDE results

in order to validate whether these non-independent inspections would constitute a future integrity hazard. TransCanada responded as follows:

"For fabrication of piping assemblies between May 2004 and August 2011, TransCanada used fabrication shops with certified Quality Management Systems. The fabrication facilities were responsible for hiring qualified third party NDE contractors to complete the inspections. TransCanada hired a third party inspector to oversee the work produced by the fabrication shop and the NDE contractor. The TransCanada inspector was responsible for ensuring the fabrication shops met the specification and procedure requirements for materials, welding, non-destructive examination, pressure testing and coating. The inspector was responsible for checking the radiographic film to ensure the level of quality was met and that all welds were inspected. The fabrication of piping assemblies was completed in accordance with the requirements of CSA Z662 and the piping assemblies were completed using TransCanada's welding specification (TEP-NDT-ADT, EDMS No. 003797402), which requires 100% NDE of welds. The TransCanada specifications for NDE required that all radiographic film interpretation be completed by a Canadian Government Standards Board (CGSB) Level II technician. TransCanada stated that the fabricated assemblies in question were all subjected to a high pressure hydrostatic test before going into service and are not considered an integrity hazard."

TransCanada completed a review of the projects on which fabrication of piping assemblies was completed for the time frame of 2004 to 2011 and determined that there are approximately 50 meter stations and 7 pipeline projects where fabricated pipeline assemblies were installed under NEB jurisdiction without independent third party NDE. To address the issue, TransCanada proposed an audit of the projects using its NDE procedure TEP-NDT-ADT, Clauses 7.2.2 to 7.2.4 (inclusive), which specifies a 15% progressive audit of the radiographs involved. The Board reviewed TransCanada's proposed audit criteria to determine whether it would provide adequate examination of the welds that had occurred in the past projects. The Board determined that TransCanada's proposed audit procedure (15% of the welds) did not meet the requirements of the OPR-99, section 17.[5] TransCanada subsequently revised its audit criteria to include 100% of the subject welds and is therefore now in compliance with the OPR-99, section 17 requirements.

To ensure that TransCanada will provide qualified, third party non-destructive examination (NDE) contractors that are hired under the direct supervision of TransCanada, and not by the pipeline, facility or fabrication contractor, TransCanada stated that it has developed new Master

[5] See the amended and re-named *National Energy Board Onshore Pipeline Regulations*, section 17, for the corresponding provision.

Service Agreement (MSA) contracts with its approved NDE contractors, under which TransCanada is solely responsible for hiring the NDE personnel. TransCanada stated that it had also developed revised Work Authorization contract documents for work not covered by the MSAs, which specifically state that the NDE contractors will be hired directly by TransCanada. As a result of its internal audit, TransCanada also developed a procedure (TEP-NDE-INSP-SHOP, Fabrication Shop Non-Destructive Examination Inspection Procedure, EDMS No. 006684544) outlining the requirements for conducting NDE in fabrication shops. This procedure had an effective date of October 15, 2011 and the procedure stated under Clause 1 that: "*TransCanada will hire: (1) A Fabricator to construct assemblies; (2) An NDE contractor to conduct non-destructive examinations of the welds; and (3) A Fabrication Inspector to inspect the results prepared by the NDE contractor.*"

Summary: Independent Third Party Non-Destructive Examination

The Board noted that had been instances where TransCanada did not ensure that qualified, third party non-destructive examination (NDE) vendors were hired under its direct supervision. Therefore, TransCanada had been non-compliant with the OPR-99, section 54(1). However, the Board also concluded that the measures taken by TransCanada to ensure independent third-party NDE inspections, as well as TransCanada's commitment to undertake an audit of 100% of the previously affected welds, adequately addresses the issue of independent third-party NDE.

2. Independent Visual Surveillance of Welders

TransCanada's internal audit concluded that, in the past, TransCanada was non-compliant with CSA Z662-11, Clause 7.10.2 (Visual Inspection), and specifically sub-clause 7.10.2.1, which states that: "*The completed welds on the outside surface of the piping shall be visually inspected for 100% of the weld length for any imperfections that are not detectable by non-destructive inspection, in accordance with documented procedures approved by the company. Such procedures shall include requirements for extent and frequency of visual inspection, personnel qualification and visual acuity, maximum viewing distance and angle, lighting conditions, evaluation tools, and reporting.*"

TransCanada's internal audit noted that TransCanada's management agreed to follow up on this issue. TransCanada's Materials Engineering met with Construction Services management, welders and foremen to discuss the issue of inspection/audit procedures for maintenance welding to ensure compliance with the requirements of CSA Z662-11, Clause 7.10.2.1. TransCanada stated that its personnel completed a full review of the welding and NDE specifications and procedures applicable to their responsibilities. A qualified technical specialist provided welder training and witnessed the qualification test welds. In addition, a revised method for tracking welder qualifications was implemented. TransCanada's Construction Services department

created and filled the position of a Construction Services Manager responsible for Equipment, Quality Assurance/Quality Control, Welding and Fabrication. The Materials Engineering Department met with the Construction Services Manager to discuss the actions that had been implemented up to the date of the internal audit, as well as the implementation of further recommendations on training and the overall inspection requirements with respect to welder supervision and inspection.

As a result of the NEB audit interviews, TransCanada provided its engineering procedure, TEP-NDT-VT Visual Examination (EDMS No. 007381161) and examples of welder inspection reports as supporting documentation that TransCanada meets the requirements set out in CSA Z662 Clause 7.10.2.1. The TEP-NDT-VT engineering procedure is based on CSA Z662-11 Oil and Gas Pipeline Systems; ASME Section V, Article 9, Guidelines; and API 1104, Welding of Pipelines and Related Facilities. The engineering procedure applies to visual examination that is to be conducted to determine the condition of the part, component or surface examined including such conditions as weld quality, alignment of mating surfaces, crack, wear, corrosion, erosion, evidence of leakage, or physical damage. The records of visual weld examinations requested by NEB auditors for a specific project (36" Edson Extension Hydro Test Project, ED-120 to ED-130, 2012) included a weld tally with visual inspection and weld parameter confirmation records, all visual inspection reports for the project, welding inspector's daily reports for the project, and the Company Representative and Welder Inspector's Check List.

Summary: Independent Visual Surveillance of Welders

The Board concluded that TransCanada was non-compliant with CSA Z662-11, Clause 7.10.2 (Visual Inspection) and specifically sub-clause 7.10.2.1. The Board also concluded that TransCanada has the processes and procedures in place to meet the requirements of CSA Z662-11, Clause 7.10.2.1 and that those processes and procedures adequately address the issue of independent visual surveillance of welders.

3. Non-Destructive Examination of Pressure Vessels

TransCanada's internal audit concluded that a variance to the American Society of Mechanical Engineers (ASME), Section V – Non-destructive Examination had occurred in that, in one instance, the NDE of a pressure vessel was known to be insufficient due to the NDE inspector being unable to inspect the full weld beneath a plate attached to a nozzle. The NDE inspection report did not meet code as it incorrectly indicated full inspection had occurred. Had the NDE inspection report indicated that the complete weld inspection had not occurred due to restricted access, the report would have met the requirements of the code.

TransCanada's response to the internal audit finding was that the pressure vessel in question was for the NGTL Gold Creek Compressor Station project. This project was taken out of service by

TransCanada's Engineering Department in September 2011. A complete review of the design drawings, fabrication welding procedures and NDE inspection procedures was completed by TransCanada through September, October and November 2011. An internal report was competed on this review and, in particular, the questions raised regarding the NDE for the nozzle weld. The review determined the NDE of the small diameter nozzles was completed, but the NDE technician referenced the incorrect procedure and did not indicate the restricted inspection area in the report. This was addressed with the third party NDE company and resolved. The pressure vessel was released for installation in November 2011 and the pressure vessel was included in the field pressure testing program for the station piping at the Gold Creek Compressor Station. The report also recommended changes to the process for procurement and third party inspection of pressure vessels. TransCanada's Materials Engineering department has revised the third party surveillance checklist used for pressure vessels and has worked directly with the third party inspection company to provide the third party inspectors with training on the specification requirements and expectations on reporting.

Summary: Non-Destructive Examination of Pressure Vessels

The Board concluded that a variance to the American Society of Mechanical Engineers (ASME), Section V – Non-destructive Examination had occurred in TransCanada's NGTL Gold Creek Compressor Station project. The Board also concluded that TransCanada has the processes and procedures in place to ensure that NDE inspections of pressure vessels meet the ASME code requirements and that reporting of NDE results accurately reflects the NDE procedures. The measures taken by TransCanada adequately address the issue of NDE of pressure vessels.

4. Qualification of Welders on the Keystone Pipeline

TransCanada's internal audit confirmed that a number of welds on the Keystone Pipeline did not comply with CSA Z662-11, Clause 7.8, Arc and Gas welding - Qualification of Welders, due to welding being performed by an unqualified welder. TransCanada stated that the lack of welder qualification was discovered by a TransCanada inspection and documents coordinator, who ordered corrective action to be taken, which consisted of removal of the welds in question. TransCanada required that all of the welds in question be redone by a qualified welder. To ensure that no other pipeline welds performed on the Keystone Pipeline were out of compliance due to welder qualifications, a review was conducted of all of the Keystone Pipeline welder qualification records. TransCanada reinforced the requirement that no work should be started on a project without the inspector present at the contractor's fabrication facility and completion of assurance of welder qualifications.

Summary: Qualification of Welders on the Keystone Pipeline

The Board concluded that TransCanada's Keystone Pipeline project contained a number of welds that were not in compliance with CSA Z662-11, Clause 7.8, Arc and Gas welding - Qualification of Welders. The Board also concluded that the measures taken by TransCanada adequately address the issue of qualification of welders on the Keystone Pipeline and that TransCanada has the processes and procedures in place to ensure appropriate welder qualifications on TransCanada's future projects.

5. Practice of Engineering within TransCanada

TransCanada's internal audit concluded that the final review and signing of designs completed by an external engineering company was done under TransCanada's permit to practice and by professional engineers registered in Alberta. To ensure TransCanada engineers and technologists were clear in their roles and responsibilities, TransCanada management implemented a review of the Engineering requirements in the Practice of Engineering specification (TES-ENG-POE, TransCanada Practice of Engineering (POE) EMDS # 003672108, revised in Nov. 2011). The Practice of Engineering specification includes guidance on the requirements for both internal TransCanada and third party engineering (Sections 5.1 and 5.2 respectively).

In 2012, TransCanada management also implemented mandatory training on TransCanada's Practice of Engineering and TransCanada's Professional Engineering Management Plan for engineers and technologists within the company. This training is currently being added into the TransCanada Learning Management System (LMS) as a requirement for Engineers to take every 3 years. TransCanada's Practice of Engineering outlines authentication requirements for engineering documents produced by or for TransCanada. TransCanada's Professional Engineering Management Plan outlines principle information regarding the management of engineering within TransCanada. TransCanada procedures related to projects have design reviews by technical and engineering resources that are designed to occur at the 30%, 60% and 90% design stages. When the work is completed by external engineering companies, the final designs are authenticated or signed by professional engineers based on the requirements of the jurisdiction in which the work and/or construction is taking place. For designs completed by internal TransCanada resources, the company's permit to practice stamp is applied.

Summary: Practice of Engineering within TransCanada

The Board concluded that TransCanada is in compliance with its internal Practice of Engineering specification governing the practice of its professional engineers. The Board also concluded that the measures taken by TransCanada adequately address the issue of practice of engineering within TransCanada and for its external engineering contractors.

6. Joining Pipe of Different Wall Thicknesses

TransCanada's internal audit investigated an allegation that using back-beveled transition welds is prone to higher incidence of failure than using counter-bore and taper welds.

The internal audit concluded that the failure incident reference was made to historical welding practices that were acceptable at that time. TransCanada stated that the use of taper (back beveling) is a common practice within the pipeline industry. Clause 7, Joining, of CSA Z662-11, provides guidance on the recommended designs of unequal wall thickness weld joints. Figure 7.1, *Examples of end preparations and combinations of end preparations*, and specifically Figure 7.1(a) with its guidance note states that for internal diameters unequal "*where the nominal internal offset is 2.4 mm or less, no special treatment is necessary, provided that full penetration and bond is accomplished in welding.*" Figures 7.1(b) through 7.1(g) and the corresponding guidance notes detail the requirements cases of internal offset greater than 2.4 mm, external diameters unequal and internal, and unequal external diameters.

The joining requirements in CSA Z662-11 were compared to TransCanada's specification for transitioning of weld joints with unequal wall thickness pipe (TEP-MECH-TRAN, Selection of Transition Pieces and Joining Methods, EDMS No. 000006256). This internal specification provides guidance on determining when to use the back bevel design or the counter-bored and taper design. TransCanada currently implements this specification when the wall thickness difference of two adjoining pieces of pipeline is greater than 1.0 mm (TEP-MECH-TRAN, Figure 2(a) through Figure 2(d) of Section 4.0). TransCanada's joining specification meets the requirements of Clause 7 of CSA Z662-11. TransCanada also manages the risk of weld joint cracking through control of welding parameters such as preheat, welding heat input and pipe movement during welding and, in addition, Section 2.0.3 of the TransCanada specification states that "*the transition weld shall not be located in the immediate region of high bending moments (such as may be generated by filed overbends, sidebends or sagbends). The transition weld shall be located at a minimum distance of 3D from the end of the bend to the transition. Unless it can be demonstrated that a lesser distance will not adversely affect the structural integrity of the pipeline.*"

Summary: Joining Pipe of Different Wall Thicknesses

The Board concluded that TransCanada's joining specification meets the requirements of CSA Z662-11, Clause 7, Joining. The Board also concluded that TransCanada has the processes and procedures in place to address the issue of joining pipe of different wall thicknesses that could affect the weld joints and the integrity of the pipeline.

7. Use of Automated Ultrasonic Testing

TransCanada's internal audit investigated an allegation that the use of Automatic Ultrasonic Testing (AUT) is more sensitive in picking up defects than radiographic inspection. TransCanada's internal audit stated that CSA Z662-11 and the OPR-99 allow for the use of radiography or ultrasonic methods to examine girth welds. TransCanada uses either AUT or radiography (RT) for the non-destructive examination of butt welds on pipeline construction. Both of these non-destructive techniques have been used in pipeline construction for many years and the requirements for their use are included in CSA Z662-11, Clause 7.10.4 Non-destructive inspection. TransCanada uses radiography for butt welds on Nominal Pipe Size (NPS) 2" to NPS 48" pipe to pipe joints or pipe to component joints. The AUT method is applied to NPS 20" to NPS" 48 pipe to pipe mainline and tie-in welds on pipelines projects where the wall thickness is 6.4 mm and greater. The minimum diameter limit is applied to the projects due to the wall thicknesses being less than 6.4 mm and the inspection system's physical size as it sits on the pipe. TransCanada's specification used for automatic ultrasonic inspection is TES-NDT-UT1, Mechanized Ultrasonic Examination of Pipeline Girth Welds (EDMS No. 00367096) that contains within the scope of the document the wall thickness limits for UT weld inspection.

Summary: Use of Automated Ultrasonic Testing
The Board concluded that TransCanada is in compliance with CSA Z662-11, Clause 7.10.4 Non-Destructive Inspection and the OPR-99 with respect to the use of radiographic and ultrasonic inspection methods. The Board also concluded that TransCanada has the processes and procedures in place to address the issue of weld inspections and that these processes and procedures meet the requirements of CSA Z662-11 and the OPR-99.

8. Submission to the NEB of TransCanada's Joining Program

TransCanada internal audit investigated an allegation that TransCanada submitted a joining program for the Cutbank River Lateral Loop Project to the NEB that had not been fully customized and updated for the Project as required by the OPR-99, section 16, which states that *"A company shall develop a joining program in respect of the joining of pipe and the components to be used in the pipeline and shall submit it to the Board when required to do so"*.
TransCanada's internal audit confirmed that the allegation was valid. An updated version of the joining program was subsequently submitted to the Board. The internal audit further noted that the learnings from the Cutbank River Lateral Loop Project led to a complete review of the standard shielded metal arc welding (SMAW) procedures to confirm that the welding datasheets were accurate and correct, to ensure the supporting documents referenced (Procedure Qualification Record (PQR) and Welding Procedure Specification (WPS)) were part of the submission to the NEB, and to ensure each datasheet was properly supported by PQRs.

TransCanada stated that, going forward, all welding procedures submitted for its projects will be reviewed for compliance prior to their issuance.

Summary: Submission to the NEB of TransCanada's Joining Program

The Board concluded that TransCanada was not in compliance with the OPR-99, section 16 with respect to submitting a customized and updated joining program for the Cutbank River Lateral Loop Project. The Board also concluded that TransCanada has the processes and procedures in place to address the issue of submission of complete, accurate and updated welding procedures to the NEB.

9. TransCanada's Formal Audit Program

TransCanada's internal audit investigated an allegation that the audit and inspection process required by the OPR-99 did not exist within TransCanada. TransCanada's internal audit confirmed that there was an audit and investigation process within TransCanada, but that there were opportunities for continuous improvement. As noted above in the Board's assessment of this audit for sub-element 4.4 Internal Audit, TransCanada has demonstrated that it has a formal audit process for its Integrity Management Programs.

Summary: TransCanada's Formal Audit Program

The Board concluded that TransCanada is in compliance with the requirements of the OPR-99, section 55(1)(b) and CSA Z662-11, Clause 3.1.2(h)(iii). The Board also concluded that TransCanada has the processes and procedures in place to address the requirements of a formal audit and inspection program.

Summary: Internal Audit

The Management System Audit Element 4.4, Internal Audit, requires a company to develop and implement a documented process for auditing its management and protection programs and procedures. The audit process is expected to include and manage training and competency requirements for staff carrying out the audits and be conducted on a regular basis.

Internal audits of TransCanada's IMPs are conducted by personnel that are independent of the areas to be audited or by a contracted third party. Quarterly field-based compliance audits are conducted at multiple locations across Canada. All audit findings are tracked and are required to be resolved. Findings are also categorized as either site-specific or systemic and responsibility for these is assigned accordingly. The progress of resolving audit findings is monitored and escalated where necessary.

With regards to the internal audit of TransCanada's investigation stemming for concerns raised by a complainant, the Board finds the company's internal audit procedures effectively identified and assigned resolution of any regulatory non-compliances.

Management System Audit Sub-Element Finding: Based on documents reviewed and interviews with personnel, TransCanada was able to demonstrate that it was in compliance with the requirements of the OPR-99 and CSA Z662-11, and is therefore compliant with the requirements of this audit sub-element.

Compliance Status: Compliant

5.0 MANAGEMENT REVIEW

5.1 Management Review

Expectations: The company shall formally review the management and protection programs for continuing suitability, adequacy and effectiveness. The review should be based on appropriate documentation and records including the results of the surveillance, monitoring and audit programs. This review should be formal and documented and should occur on a regular basis. The management review should include a review of any decisions, actions and commitments that relate to the improvement of the programs and the company's overall performance.

OPR-99 sections 4, 40 and 55

CSA Z662-11, Clauses 3.1.2 (h)(iii) and 3.2

Audit Assessment:

General

During interviews and in documents submitted, TransCanada described its management review processes and procedures.

At quarterly meetings of the Board of Directors' Health, Safety and Environment (HSE) Committee, TransCanada leadership present and discuss a scorecard on Operational Safety, which includes the Integrity Management Program (IMP) elements.

TransCanada's Senior Vice President of Operations and Engineering leads the Senior Governance Committee (SGC), which includes the Vice Presidents of Engineering and Asset Reliability, Canadian Pipeline Operations and Operations and Pipeline Services. The SGC provides the highest level of management governance, overseeing strategic aspects such as the policy and direction of the Asset Management System (AMS), which governs TransCanada's IMPs. The following sections of the IMPs provide the processes and procedures that are necessary to meet the requirements of the AMS:

- Gas Pipeline IMP, Section 8.0;
- Liquid Pipeline IMP, Section 2.1; and
- Plant IMP, Section 2.2.

TransCanada Threat Management Scorecards

TransCanada submitted documents (Integrity Threat Management Scorecards) to demonstrate that it had compiled and analyzed key performance indicator (KPI) and incident data. The TransCanada Integrity Threat Management Scorecards submitted and reviewed were:

- Internal Corrosion;
- External Corrosion;
- Mechanical Damage;
- Construction Defects;
- Weather and Outside Forces;
- Manufacturing Defects;
- Equipment;
- Stress Corrosion Cracking;
- Leaks and Ruptures;
- Engineering and Asset Reliability Incident and Issue Tracking (IIT); and
- Customer Perfect Days.

TransCanada's Scorecards contained information on the individual threat management programs, including: goals and objectives; failure statistics (incident rates x 10^3 per km·yr) due to each threat; in-service leaks and ruptures; and histograms and pie charts of threat related data. The Scorecards were assessed to be in compliance with CSA Z662-11, Clauses 3.1.2 (h)(iii) and 3.2 (d).

Key Performance Indicators

At the beginning of each year, the SGC sets direction through goals and objectives, along with overall KPIs for the IMPs. These common goals and objectives cascade down through the organization from the SGC to the individual employee. At each successive level of the organization, more specific goals, objectives and KPIs are monitored and reviewed to evaluate TransCanada's various programs, including the IMPs, for continued suitability, adequacy and effectiveness. At the SGC level, monthly management review meetings are held to discuss the KPI areas of asset reliability, safety, compliance, risk and cost. Regular updates through the chain of command are provided though weekly reporting and a monthly review of all outstanding incidents and issues.

Management Review System for the IMPs

Responsibility for review and revision of the IMPs extends from the IMP program manager up through the respective leadership team to the Vice President of Engineering and Asset Reliability. The IMPs and supporting documentation are revised on a regular basis to capture any significant improvement opportunities. Modification to the IMPs and their associated supporting procedures and processes is typically driven by lessons learned, and include the following inputs:

- IIT;
- Review of goals and objectives through KPIs;
- Audit findings and follow-up actions;
- IMP Reviews; and
- Industry learnings.

Incident and Issue Tracking (IIT)

IIT is the primary mechanism by which TransCanada identifies and takes actions on incidents and issues, including those related to the IMP. Automated notifications facilitate management oversight and governance. Resolution of action items is tracked within the IIT system and is to be reviewed monthly by the appropriate leadership within TransCanada.

Review of Goals and Objectives through Key Performance Indicators

To evaluate the IMPs for continued suitability, adequacy and effectiveness, common goals and objectives used to monitor progress cascade down through each level of the organization and are reflected in the specific KPIs. At the Vice President level, more detailed KPIs are part of the Engineering and Asset Reliability Leadership Team management review. At the Director and Manager level, more detailed KPIs are tracked for the IMP and associated procedures as part of the IMPs. During the audit, TransCanada provided documentation (TransCanada KPIs – Performance Measures, December 2012) on its IMP related KPIs. In general, in the 500+ KPIs provided, there were numerous listings of what are considered to be pipeline attributes rather than KPIs. For example, pipeline system length, outer diameter, wall thickness, material grade, design class, coating type and pipe manufacturer. These are simply fixed attributes of the pipeline system and provide no useful information for tracking performance. Additionally, of the extensive list of KPIs provided, only a few have provided direct input into the individual threat management scorecards.

Integrity Management Program Reviews

Specific IMP review activities are conducted, including:

- Management Business Reviews: Semi-annually, a meeting between the Pipe Integrity leadership team and individual subject matter experts is held to review the status of their individual programs. At the end of the year, Facilities Integrity conducts a business review that includes a Strengths, Weakness, Opportunities and Threats (SWOT) Analysis, to align key strategies with the facilities' objectives. The objectives are then linked to success of the integrity programs and plans being implemented in the following year.
- Annual Maintenance Plan Review: Integrity threat groups develop annual maintenance plans, which form the work plan to be completed in the following year. On an annual basis, leadership up to the Senior Vice President of Engineering and Operations is provided an overview of the previous year's maintenance plan and the proposed next year's maintenance plan.
- Process Reviews: The outcome of the reviews of IMP supporting documents (e.g., integrity plans, procedures) is reported to management. The TEP-INT-PR Pipe Integrity Process Review Procedure (EDMS No. 006522487) outlines Pipe Integrity's process review methodology. The TEP-INT-MREV Pipe Integrity Management Review Procedure (EDMS No. 006980169) details the management review process of Pipe Integrity's natural gas integrity management programs. During the audit, TransCanada provided the Integrity Management Program Review (January 26 – February 12, 2010) as an example of its IMP review report. Essentially, the 16 page document, of which 6 pages contained the actual review, was a high level process review rather than a zero-based compliance and effectiveness review of TransCanada's IMPs. Within the document, TransCanada stated that a technical review of the data and reports generated by the various activities, assessments and plans was not included in the scope. Appendix 2 – Integrity Management Program Checklist contained 25 questions meant to cover 12 management sections (with 4 missing sections in the numbering system). Appendix 2 in the report was blank. No information was contained in the report on the answers to the questions or references to documentation examined. This Integrity Management Program Review document was assessed to be inadequate for the purpose stated and inadequate as evidence of TransCanada's management review process.

Industry Learnings

TransCanada stated that it also tracks its performance relative to industry by participating in industry associations, such as the Canadian Energy Pipeline Association (CEPA). For the past ten years, CEPA has tracked approximately 30 KPIs, allowing TransCanada to compare itself to industry using detailed measures such as failure causation, in-line inspections and site investigations. During the audit, TransCanada provided documentation (excerpts from the

Annual Performance Indicator Report 2012 (EDMS No. 008029673) to illustrate a comparison of its KIPs to those of other regulatory agencies and of industry associations.

Summary: Management Review

The Management System Audit Element 5.1, Management Review, requires a company to formally review its management and protection programs for continuing suitability, adequacy and effectiveness. Reviews are expected to be based on appropriate documentation and records, be formal and documented, and occur on a regular basis.

The audit concluded TransCanada has undertaken several initiatives aimed at reviewing its IMPs. These include:

- Designating an executive to be accountable for management review;
- Having appropriate levels of responsibility and accountability at each level of the organization; and
- Participation in industry associations in order to share learnings and best practices.

Some of the non-compliances identified during the audit, such as insufficient overpressure protection and management of hazards associated with external corrosion, illustrate the results of a management review process that was not effective. This element of the audit also included a review of the allegations presented by the complainant along with the corroborating internal review by TransCanada resulting from that complaint.

Management System Audit Element Finding: Based on the documents assessed and interviews with personnel as related to Management Review, TransCanada is assessed to be non-compliant with the requirements of the OPR-99 and CSA Z662-11, and is therefore non-compliant with this audit sub-element.

Compliance Status: Non-Compliant

Analysis of Frequency, Magnitude and Consequence of Worst-Case Spills From the Proposed Keystone XL Pipeline

John Stansbury, Ph.D., P.E.

Executive Summary

TransCanada is seeking U.S. regulatory approval to build the Keystone XL pipeline from Alberta, Canada to Texas. The pipeline will transport diluted bitumen (DilBit), a viscous, corrosive form of crude oil across Montana, South Dakota, Nebraska, Kansas, Oklahoma and Texas. As part of the regulatory process, TransCanada is required by the National Environmental Policy Act (NEPA) to evaluate the potential environmental impacts of a pipeline spill. The Clean Water Act (CWA) also requires TransCanada to estimate the potential worst-case discharge from a rupture of the pipeline and to pre-place adequate emergency equipment and personnel to respond to a worst-case discharge and any smaller spills. The Keystone XL environmental assessment documents (e.g., Draft Environmental Impact Assessment) as well as the environmental impacts documents for the previously built Keystone pipeline, can be found on the US State Department web site. It is widely recognized that the environmental assessment documents for the Keystone XL pipeline are inadequate, and that they do not properly evaluate the potential environmental impacts that may be caused by leaks from the pipeline (e.g., USEPA 2011a). The purpose of this paper is to present an independent assessment of the potential for leaks from the pipeline and the potential for environmental damage from those leaks.

The expected frequency of spills from the Keystone XL pipeline reported by TransCanada (DNV, 2006) was evaluated. According to TransCanada, significant spills (i.e., greater than 50 barrels (Bbls)) are expected to be very rare (0.00013 spills per year per mile, which would equate to 11 significant spills for the pipeline over a 50 year design life). However, TransCanada made several assumptions that are highly questionable in the calculation of these frequencies. The primary questionable assumptions are: (1) TransCanada ignored historical data that represents 23 percent of historical pipeline spills, and (2) TransCanada assumed that its pipeline would be constructed so well that it would have only half as many spills as the other pipelines in service (on top of the 23 percent missing data), even though they will operate the pipeline at higher temperatures and pressures and the crude oil that will be transported through the Keystone XL pipeline will be more corrosive than the conventional crude oil transported in existing pipelines. All of these factors tend to increase spill frequency; therefore, a more realistic assessment of expected frequency of significant spills is 0.00109 spills per year per mile (from the historical data (PHMSA, 2009)) resulting in 91 major spills over a 50 year design life of the pipeline.

The CWA requires that TransCanada estimate the "worst-case spill" from the proposed pipeline (ERP, 2009). TransCanada's calculation of the worst-case spill from the proposed Keystone XL pipeline was not available at the time of this assessment, so an assessment of the methods used by TransCanada for the existing Keystone pipeline and a comparison of the results of those methods with the methods recommended in this analysis were made. The worst-case spill volume at the Hardisty Pumping Station on the Keystone (the original pipeline will be referred to as simply the Keystone pipeline while the proposed pipeline is the Keystone Xl pipeline) pipeline predicted using methods recommended in this analysis was 87,964 barrels (Bbl), while the worst-case spill predicted using TransCanada's methods was 41,504 Bbl (ERP, 2009). The difference is a factor of more than 2 times. The primary difference between the two methods was the expected time to shut down the pumps and valves on the pipeline.

013781

TransCanada used 19 minutes (TransCanada states that it expects the time to be 11.5 minutes for the Keystone XL pipeline). Since a very similar pipeline recently experienced a spill (the Enbridge spill), and the time to finally shutdown the pipeline was approximately 12 hours, and during those 12 hours the pipeline pumps were operated for at least 2 hours, it is clear that the assumption of 19 minutes or 11.5 minutes is not appropriate for the shut-down time for the worst-case spill analysis. Therefore, worst-case spill volumes are likely to be significantly larger than those estimated by TransCanada. The worst-case spill volumes from the Keystone XL pipeline for the Missouri, Yellowstone, and Platte River crossings were estimated by this analysis to be 122,867 Bbl, 165,416 Bbl, and 140,950 Bbl, respectively. In addition, this analysis estimated the worst-case spill for a subsurface release to groundwater in the Sandhills region of Nebraska to be 189,000 Bbl (7.9 million gallons).

Among numerous toxic chemicals that would be released in a spill, the benzene (a human carcinogen) released from the worst-case spill into a major river (e.g., Missouri River) could contaminate enough water to form a plume that could extend more than 450 miles at concentrations exceeding the Safe Drinking Water Act Maximum Contaminant Level (MCL) (i.e., safe concentration for drinking water). Therefore, serious impacts to drinking water intakes along the river would occur. Contaminants from a release at the Missouri or Yellowstone River crossings would enter Lake Sakakawea in North Dakota where they would adversely affect drinking water intakes, aquatic wildlife, and recreation. Contaminants from a spill at the Platte River crossing would travel downstream unabated into the Missouri River for several hundred miles and affect drinking water intakes for hundreds of thousands of people in cities like Lincoln, NE; Omaha, NE; Nebraska City, NE; St. Joseph, MO; and Kansas City, MO, as well as aquatic habitats and recreational activities. In addition, other constituents from the spill would pose serious risks to aquatic species in the river. The Missouri, Yellowstone, and Platte Rivers all provide habitat for threatened and endangered species including the pallid sturgeon, the interior least tern, and the piping plover. A major spill in one of these rivers could pose a significant threat to these species.

The benzene released by the worst-case spill to groundwater in the Sandhills region of Nebraska would be sufficient to contaminate 4.9 billion gallons of water at concentrations exceeding the safe drinking water levels. This water could form a plume 40 ft thick by 500 ft wide by 15 miles long. This plume, and other contaminant plumes from the spill, would pose serious health risks to people using that groundwater for drinking water and irrigation.

Introduction

TransCanada is seeking U.S. regulatory approval to build the Keystone XL pipeline from Alberta, Canada to Texas. The pipeline will transport diluted bitumen (DilBit), a viscous, corrosive form of crude oil across Montana, South Dakota, Nebraska, Kansas, Oklahoma, and Texas. As part of the regulatory process, TransCanada is required by the National Environmental Policy Act (NEPA) to evaluate the potential environmental impacts of a pipeline spill. The Clean Water Act (CWA) also requires TransCanada to estimate the potential worst-case discharge from a rupture of the pipeline and to pre-place adequate emergency equipment and personnel to respond to a worst-case discharge and any smaller spills. The Keystone XL environmental assessment documents (e.g., Draft Environmental Impact Assessment) as well as the environmental impacts documents for the previously built Keystone pipeline, can be found on the US State Department web site. It is widely recognized that the environmental assessment documents for the Keystone XL pipeline are inadequate, and that they do not properly evaluate the potential environmental impacts that may be caused by leaks from the pipeline (e.g., USEPA, 2011a). The purpose of this paper is to present an independent assessment of the potential for leaks from the pipeline and the potential for environmental damage from those leaks.

013782

In addition to evaluating potential environmental damage from pipeline leaks, TransCanada is required by law to pre-position emergency equipment and personnel to respond to any potential spill. This paper does not address these requirements. However, an independent assessment of TransCanada's emergency response plans for the previously built Keystone pipeline was done by Plains Justice (Blackburn, 2010). This document clearly shows that the emergency response plan for the Keystone pipeline is woefully inadequate. Considering that the proposed Keystone XL pipeline will cross much more remote areas (e.g., central Montana, Sandhills region of Nebraska) than was crossed by the Keystone pipeline, there is little reason to believe that the emergency response plan for Keystone XL will be adequate.

Since spills from these pipelines will occur, and since they will be extremely difficult and expensive to clean up (likely tens to hundreds of millions of dollars), it is imperative that TransCanada be required to be bonded for these clean-up costs before any permits are granted. This proposed requirement is supported by the recent Enbridge spill, where a smaller crude-oil pipeline leak released crude oil into a tributary of the Kalamazoo River, and early clean-up costs, as reported by the U.S. EPA, have exceeded $25 million.

Worst-Case Spill

One of the requirements of the CWA is to calculate the worst-case potential spill from the pipeline. An assessment of the potential worst-case spill from the Keystone pipeline was conducted by TransCanada; however, some of the methods and assumptions in that assessment are in question. The primary focus of this paper is to provide an independent assessment of the worst-case spill from the Keystone XL pipeline and to compare that to the assessment done by TransCanada.

Spill frequency

To support understanding of the potential impacts due to releases from the pipeline, an assessment of the likely frequency of spills from the pipeline is made. TransCanada calculated the likely frequency of a pipeline spill for the Keystone XL pipeline in the Draft Environmental Impact Statement (ENTRIX, 2010) using statistics from the Pipeline and Hazardous Materials Safety Administration (PHMSA). Nation-wide statistics from PHMSA for spills from crude oil pipelines show 0.00109 significant (i.e., greater than 50 Bbl) spills per mile of crude oil pipelines per year. When this rate is applied to the Keystone XL pipeline with a length of 1,673 miles, the expected frequency of spills is 1.82 spills per year (0.00109 spills/mi * 1,673 mi). Adjusting the nation-wide PHMSA data to only include data from the states through which the Keystone XL pipeline will pass results in a frequency of 3.86 spills per year for the pipeline length (ENTRIX, 2010). The state-specific data are more applicable to the Keystone location; however, the smaller state-specific data base might over-estimate spill frequency. Therefore, the frequency of 1.82 per year is adopted as the best available value for this assessment. Assuming a design life of 50 years for the pipeline, 1.82 spills per year results in 91 expected significant spills (i.e., greater than 50 barrels) for the Keystone Pipeline project. According to the TransCanada Frequency-Volume Study of the Keystone Pipeline (DNV, 2006), 14 percent of the spills would likely result from a large hole (i.e., greater than 10 inches in diameter). Using the 14 percent value, the 91 expected spills during a 50-year lifetime for the pipeline would result in 13 major spills (i.e., from holes larger than 10 inches in the pipeline).

However, TransCanada diverged from historical data and modified the estimate of the expected frequency of spills from the pipeline (DNV, 2006). The company's primary rationale for reducing the frequency of spills from the pipeline was that modern pipelines are constructed with improved materials and methods. Therefore, TransCanada assumed that pipelines constructed with these new improved

013783

materials and methods are likely to experience fewer leaks. The revised expected frequency for spills was reported in the Frequency-Volume Study (DNV, 2006) to be 0.14 spills/year over the 1,070 miles from the Canadian border to Cushing, OK. This value was adjusted to 0.22 spills per year for the total 1,673 miles of pipeline, including the Gulf Coast Segment (ENTRIX, 2010). Using the 0.22 spills/year, TransCanada predicted 11 spills greater than 50 barrels would be expected over a 50-year project life.

This reduced frequency estimated by TransCanada is probably not appropriate for a couple of reasons. First, the study of the revised frequency ignored some of the historical spill data; i.e., the spill cause category of "other causes" in the historical spill data set (DNV, 2006). The "other causes" category was assigned for spills with no identified causes. Since this category represents 23 percent of the total spills, this is a significant and inappropriate reduction from the spill frequency data. In addition, the assumed reduction in spill frequency resulting from modern pipeline materials and methods is probably overstated for this pipeline. TransCanada used a reduction factor of 0.5 in comparison to historical data for this issue. That is, according to TransCanada, modern pipeline construction materials and methods would result in half as many spills as the historical data indicate. However, the PHSMA data used in the TransCanada report were from the most recent 10 years. Therefore, at least some of the pipelines in the analysis were modern pipelines. That is, the initial frequency estimate was calculated in part with data from modern pipelines; therefore, a 50 percent reduction of the frequency estimates is highly questionable based on the data set used. More importantly, DilBit, the type of crude oil to be transported through the Keystone XL pipeline will be significantly more corrosive and abrasive than the conventional crude oil transported in most of the pipelines used in the historical data set. The increased corrosion and abrasion are due to 15 – 20 times the acidity (Crandall, 2002), 5 – 10 times the sulfur content (Crandall, 2002), and much higher levels of abrasive sediments (NPRA, 2008) compared to conventional crude oil. In addition, the high viscosity of DilBit requires that the pipeline be operated at elevated temperatures (up to 158oF for DilBit and ambient temperature for conventional oil) and pressures (up to 1440 psi for DilBit and 600 psi for conventional oil) compared to conventional crude oil pipelines (ENTRIX, 2010). Since corrosion and pressure are the two most common failure mechanisms resulting in crude oil releases from pipelines (DNV, 2006), increased corrosion and pressure will likely negate any reduced spill frequency due to improvement in materials and methods. Although pipeline technology has improved, new pipelines are subject to proportionally higher stress as companies use this improved technology to maximize pumping rates through increases in operational pressures and temperatures, rather than to use this improved technology to enhance safety margins.

Also, TransCanada relies heavily on "soft" technological improvements, such as computer control and monitoring technology, rather than only on "hard" improvements, such as improved pipe fabrication technology. Whereas "hard" technological improvements are built into pipelines, "soft" improvements require an ongoing commitment of monitoring and maintenance resources, which should not be assumed to be constant over the projected service life of the pipeline, and are also subject to an ongoing risk of error in judgment during operations. As demonstrated by the spill from Enbridge's pipeline into the Kalamazoo River, as pipelines age maintenance costs increase, but pipeline company maintenance efforts may be insufficient to prevent major spills, especially if operators take increased risks to maintain return on investment. Moreover, TransCanada assumes that future economic conditions will allow it to commit the same level of maintenance resources from its first year to its last year of operation. Given future economic uncertainty, this is not a reasonable assumption. It is reasonable to assume that decades from now TransCanada or a future owner will likely fail to commit adequate maintenance resources, fail to comply with safety regulations, or take increased operational risks during periods of lower income. Overtime, PHMSA should assume that the risk of spill from the Keystone XL Pipeline will increase due to weakening of "soft" technological enhancements. Over the service life of the pipeline it is not reason-

able to rely on TransCanada's "soft" technological improvements to the same extent as built-in "hard" improvements.

The TransCanada spill frequency estimation consistently stated the frequency of spills in terms of spills per year per mile. This is a misleading way to state the risk or frequency of pipeline spills. Spill frequency estimates averaged per mile can be useful; e.g., for extrapolating frequency data across varying pipeline lengths. However, stating the spill frequency averaged per mile obfuscates the proper value to consider; i.e., the frequency of a spill somewhere along the length of the pipeline. Stating the spill frequency in terms of spills per mile is comparable to acknowledging that although some 33,000 deaths from automobile accidents occur annually in the U.S., the average annual fatality rate across 350 million people is only 0.000094; therefore, fatalities from automobile accidents are so rare as to be unimportant. In other words, it is of little importance to know the risk (frequency) of a release in any particular mile segment (frequency per mile); rather it is important to know the risk of a release from the pipeline. As shown above, the expected number of spills for the pipeline over the pipeline lifetime ranges between 11 and 91 spills, depending on the data and assumptions used.

In summary, there is no compelling evidence to reduce the frequency of spills because of modern materials and methods. The increased corrosiveness and erosiveness of the product being transported will likely cancel any gains due to materials and methods improvements and soft technological safeguards will likely become less effective over time. Moreover, the modified frequency stated by TransCanada should not have been reduced by omitting an important failure category. The frequency of spills should have been stated as frequency of spills across the pipeline length per year and per pipeline lifetime. Therefore, the best estimate for spill frequency is the value from the PHSMA historical data set resulting in 1.82 spills/yr or 91 significant spills over the pipeline lifetime. Table 1 compares the predicted number of spills over the lifetime of the pipeline computed from TransCanada's assumptions and from historical data.

Table 1: Predicted Number of Spills from Keystone XL Pipeline Over a 50-Year Lifetime.

	TransCanada Estimate	Estimates Using Historical Data
Spills per year per mile	0.00013[(a)]	0.00109[(a)]
Pipeline spills per year	0.22[(b)]	1.82[(b)]
Pipeline spills per 50-year lifetime	11[(c)]	91[(c)]
Pipeline spills from > 10 inch hole	1.54[(d)]	12.74[(d)]

(a) ENTRIX, 2010

(b) spills/year-mile *1673 miles

(c) spills/year* 50 years of pipeline lifetime

(d) spills/lifetime * 14 percent spills from > 10 inch hole

Most Likely Spill Locations

Crude oil could be spilled from any part of the pipeline system that develops a weakness and fails. Likely failure points include welds, valve connections, and pumping stations. A vulnerable location of special interest along the pipeline system is near the side of a major stream where the pipeline is underground but at a relatively shallow depth. At these locations, the pipeline is susceptible to high rates of corrosion because it is below ground (DNV, 2006). Since the pipeline is below ground, small initial leaks due to corrosion-weakened pipe would potentially go undetected for extended periods of time (e.g., up to 90 days) (DNV, 2006) providing conditions for a catastrophic failure during a pressure spike.

013785

In these locations, pressures would be relatively high due to the low elevation near the river crossing. In addition, major leaks at these locations are likely to result in large volumes of crude oil reaching the river.

In addition to river crossings, areas with shallow groundwater overlain by pervious soils (such as the Sandhills region in Nebraska) where slow leaks could go undetected for long periods of time (e.g., up to 90 days) (DNV, 2006), pose risks of special concern.

Worst Case Spill Volume

The volume of a spill is calculated in two parts: the pumping rate volume and the drain-down volume. The pumping rate volume is the volume of crude oil that is pumped from the leaking pipe during the time between the pipe failure and stoppage of the pumps. The time to shut down the pumps after a leak can be divided into two phases: the time to detect the leak, and the time to complete the shut-down process. The pumping rate volume also depends on the size of the hole in the pipe and the pressure in the pipe. The drain-down volume is the volume of crude oil that is released after the pumps are stopped, as the crude oil in the pipe at elevations above the leak drains out. The following sections explain how the pumping rate volume, the drain-down volume, and the total spill volume is calculated.

Pumping Rate Volume

The pumping rate volume is calculated as:

PRV = PR * (DT + SDT)

Where:

PRV = pumping rate volume (Bbl)

PR = pumping rate (Bbl/min)

DT = detection time (time required to detect and confirm a leak and order pipeline shut-down (min))

SDT = shut-down time (time required to shut down pumps and to close valves (min))

TransCanada's Frequency-Volume Study (DNV, 2006) states that detection of a leak in an underground pipeline section can range from 90 days for a leak less than 1.5 percent of the pipeline flow rate to 9 minutes for a leak of 50 percent of the pipeline flow rate. The 90-day time to detection is for a very slow leak that would not be detected by the automatic leak detection system. The 9 minute time to detection is for a leak that is large enough to be readily detected by the leak detection system. However, this time estimate is questionable because, as has been shown by experience, it is difficult for the leak detection system to distinguish between leaks and other transient pressure fluctuations in a pipeline transporting high viscosity materials such as DilBit. For example, in the Enbridge pipeline spill, signals from the leak detection system were misinterpreted, and up to 12 hours elapsed between the time of the leak and final pipeline shut-down (Hersman, 2010). During the 12-hour period between the initial alarm and the final shut-down, the pipeline pumps were operated intermittently for at least two hours. It should be noted that the location of the Enbridge spill was a populated area where field verification of the leak should have been quick and easy. Indeed, local residents called 911 complaining about petroleum odors (likely from the leak) 10 hours before the pipeline was shut down. In the case of the Keystone XL pipeline, leaks could occur in remote areas (e.g., central Montana, or the Sandhills region of Nebraska) where direct observation would only occur by sending an observer to the suspected site; this could take many hours.

013786

TransCanada states that the time to complete the pipeline shut-down sequence is 2.5 minutes (ERP, 2009). Therefore, using TransCanada's time estimates, for a 1.5 percent leak, the total time between leak initiation and shut-down could be up to 90 days, and for a large (>50 percent) leak, the total time between leak initiation and shut-down would be 11.5 minutes (ERP, 2009).

However, given the difficulty for operators to distinguish between an actual leak and other pressure fluctuations, the shut-down time for the worst case volume calculation should not be considered to be less than 30 minutes for a leak greater than 50 percent of the pumping rate. This would allow for 4 alarms (5 minutes apart) to be evaluated by operators and a 5th alarm to cause the decision to shut down. In addition, the time to shut down the systems (pumps and valves) would require another 5 minutes. The assumption that the decision to shut the pipeline down can be made after a single alarm, as is suggested by TransCanada (ERP, 2009) is unreasonable considering the difficulty in distinguishing between a leak and a pressure anomaly. The ability to make the decision to shut down the pipeline after 5 alarms is likely a reasonable "best-case" assumption. However, this "best-case" does not describe the "worst case" conditions that are being assessed here. Rather, the worst case should consider confusing and confounding circumstances where a shut-down decision is not clear and where the leak site is remote and not verifiable in a short time period. The total time is then considered to be between 30 minutes (a best-case scenario) and 12 hours (the time for the Enbridge final shut-down) from leak initiation to shut-down. Considering that the Keystone XL pipeline will cross extremely remote areas and that verification of a leak could take many hours, a shut-down time of 2 hours (i.e., the time the pumps were operated during the Enbridge shutdown process) is a reasonable time for the worst-case analysis.

Therefore, for the worst-case spill for a large leak, a shut-down time of 2 hours is assumed. With a maximum pumping rate of 900,000 Bbl/d, and a shut-down time of 2 hours, the pumping rate volume is 75,000 Bbl (900,000 Bbl/d * 1 d/24 hr * 2 hr). This pumping rate volume (75,000 Bbl) is used in the calculation of the total worst-case spill volume for all high-rate leaks (i.e., greater than 50 percent flow-rate).

The worst-case spill for a small leak could occur where the pipeline is buried and in a remote location (such as central Montana or the Sandhills region of Nebraska), and where direct observation would be infrequent. According to TransCanada documents (DNV, 2006), a slow leak of less than 1.5 percent of the pumping rate could go undetected for up to 90 days. However, since pipeline inspections are scheduled every few weeks, it is likely that the oil would reach the surface and be detected before the entire 90 days elapsed. Assuming that the pipeline is buried at a depth of 10 feet and that the 1.5 percent leak (75,802 ft^3/d) is on the bottom of the pipe, oil would fill the pore spaces in the soil mostly in a downward direction, but it would also be forced upward toward the surface. Assuming that the oil initially fills a somewhat conical volume that extends twice as far below the pipeline as above it, the oil would emerge at the surface within about one day (volume of a cone 30 feet deep with a base diameter of 30 feet is 7,068 ft^3). Therefore, the leak would likely be detected in 14 days during the next inspection (assuming bi-weekly inspections). A 1.5 percent spill at a pumping rate of 900,000 Bbl/d over 14 days would result in a release of 189,000 Bbl (7.9 million gallons).

013787

Table 2: Pumping Rate Volume for Various Sized Leaks

Leak as percent of Pumping Rate[a]	Detection and Shut-Down Time	Pumping Rate Volume[d]
<1.5 percent	14 days[b]	189,000 Bbl
100 percent	2 hours	75,000 Bbl
100 percent	11.5 minutes[c]	7,188 Bbl

(a) Design pumping rate for Keystone XL = 900,000 Bbl/d. Calculation of worst-case spill requires 100 percent of pumping rate.

(b) Time between pipeline inspections.(DNV, 2006)

(c) TransCanada's assumed shut-down time (ERP, 2009)

Drain-Down Volume

The drain-down volume is the volume in the pipe between the leak and the nearest valve or the nearest high point. Some oil in locally isolated low spots will tend to remain in the pipe. TransCanada arbitrarily assigned a drain-down factor of 0.6 for the Keystone XL pipeline, meaning that 40 percent of the oil in the draining pipeline at elevations above the leak will be captured in low spots. However, since siphon effects will tend to move much of the oil even in local low spots, the 40 percent retention factor is likely too high for a worst-case analysis. PHMSA regulations require valves to be placed on either side of a major water crossing. If these valves are working, they should limit the amount of crude oil that drains from the pipeline to the amount that is between the valves. However, to calculate a worst case spill, the volume should be calculated assuming that at least some of the valves fail (recall the failures of the safety devices in the recent Gulf oil spill). If the valves fail, the drain-down volume would be limited by the major high elevation points on either side of the leak, with a reasonable adjustment for residual crude oil remaining in the pipeline. For this worst-case analysis, a reasonable estimate for residual crude oil remaining in the pipeline is assumed at 20 percent of the total volume of oil at elevations above the leak. All of these parameters are site-specific; therefore, for this assessment, the worst case drain-down volumes will be calculated for several of the river crossings of the Keystone XL pipeline, including the Missouri, Yellowstone, and Platte Rivers.

The drain-down volume is calculated using:

$$DDV = PLDV * DF$$

Where:

DDV = Drain Down volume (Bbl)

PLDV = Pipeline Drain Volume (Bbl) (volume of pipeline either side of the leak to next valve or high elevation point)

DF = Drainage Factor (80 percent)

Worst-Case Release Calculation for the Missouri River Crossing

The Missouri River crossing is located at mile post (MP) 89 along the Keystone XL pipeline. The upstream valve is located at MP84, and the downstream valve is located at MP 91. The river is at an elevation of 2,035 feet. Figure 1 shows the elevation profile of the crossing at the Missouri River. Since there are no major high elevations between the river and the valve at MP 84, it is likely that nearly all of the oil in the pipeline between the valve and a hypothetical leak at the river will be siphoned or drained via gravity. If the valve at MP 84 fails, all of the oil in the pipeline between that point and the next valve (MP 81.5) could drain since the pipeline rises gradually in elevation between MP 84 and MP 81 (eleva-

013788

tion of 2,225 feet). If the valve on the downstream side of the crossing (MP 91) fails, oil in the pipeline up to the major high point at MP 93 could drain to the hypothetical leak at the river crossing.

There are several scenarios that could affect the drain-down volume. In the worst-case scenario both valves could fail, and the drain-down volume would then be the cross-sectional area of the pipe, times the length of pipeline draining times 80 percent. For this scenario, the length of pipe is 11.5 miles (MP 81.5 to MP 93). The cross-sectional area of the 36 inch pipe is 7.07 ft^2. Thus the drain-down volume is $3.43x10^5$ ft^3 (61,164 Bbls, 2.57 million gallons). However it is highly unlikely that both valves will fail at the same time.

A second scenario would occur if both valves operated correctly but the siphon effect removed the oil from the high point downstream of the valve at MP 84. Under this scenario, the length of drained pipe is 7 miles, and the resulting drain-down volume is $2.09x10^5$ ft^3 (37,230 Bbls, 1.56 million gallons).

A third scenario would occur if both valves operated correctly,and the siphon effect did not remove the oil between the high point at MP 86.5 and the valve at MP 84. In this scenario, the length of drained pipe is 4.5 miles (valve at MP 91 to the high point at MP 86.5), and the drain-down volume is $1.34x10^5$ ft^3 (23,934Bbls, 1.01 million gallons).

A fourth scenario would occur if one of the valves fails. To be conservative, the valve closest to the river will be the assumed failed valve. In this scenario, the drain-down distance would be 9 miles (between the valve at MP 84 and the high point at MP 93). The resulting drain-down volume would be 2.69×10^5 ft^3 (9 mi * 5,280 ft/mi * 7.07 ft^2 * 0.8) (47,867 Bbl, 2.01 million gallons).

While the first scenario is very unlikely, valve failure is a reasonable consideration in the worst-case spill analysis. So for the purposes of this analysis the fourth scenario, where one of the valves fails, is used to calculate the worst-case spill drain-down volume for the Missouri River crossing site. Therefore, using the fourth drain-down scenario, the drain-down volume is 47,867Bbls. Adding the pumping rate volume of 75,000 Bbl, the worst-case release volume for the Missouri River crossing is 122,867 Bbl (5.16 million gallons).

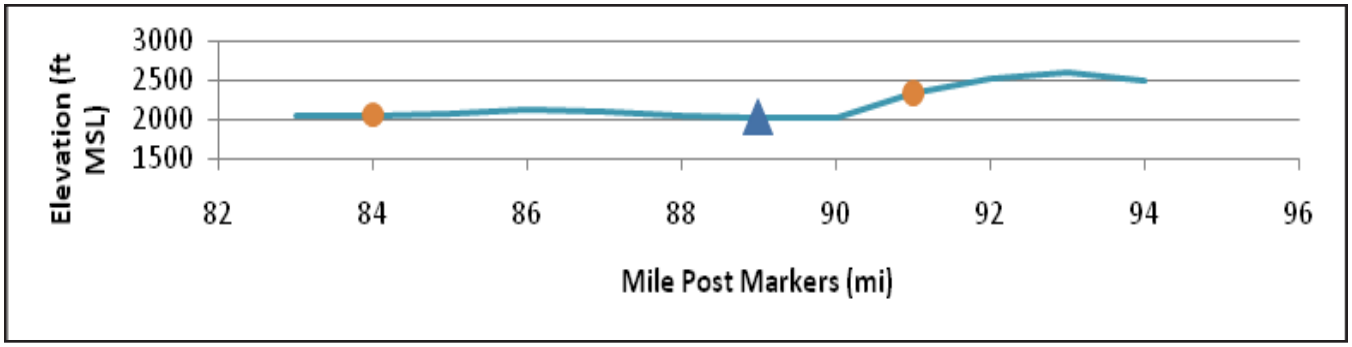

Figure 1: Horizontal profile of surface elevations at the Missouri River crossing. Note that the vertical axis is exaggerated compared to the horizontal axis. Solid circles show locations of pipeline valves. The solid triangle shows the location of the river crossing.

Worst Case Release Volume Calculation for the Yellowstone River

The crossing on the Yellowstone River is at MP 196.5 which is at an elevation of 2,125 feet. The closest upstream valve is at MP 194.5 at an elevation of 2,230 feet. The nearest major high point on the upstream side is at MP 183 at an elevation of 2,910 feet. The closest valve on the downstream side is at MP 200 at an elevation of 2,506 which is also the high point on the downstream side of the crossing. Figure 2 shows the elevation profile for the crossing at the Yellowstone River.

013789

The first scenario for drain-down volume is if all valves work properly. The drain-down volume is 80 percent of the volume between the valves (the cross-sectional area of the pipe (7.07 ft^2) times the pipe length between the valves (5.5. miles)) which equals $1.64x10^5$ ft^3 (29,252 Bbl, 1.23 million gallons).

Another scenario considers the volume if the valve at MP 194.5 does not work. In this case, the drain-down volume is the volume of the pipe between the two high elevations which are at MP 183 and MP 200 (17 miles). In this scenario the drain-down volume is $5.07x10^5$ ft^3 (90,416 Bbl, 3.80 million gallons). Assuming failure of the valve at mile-post 194.5 is a reasonable assumption for conditions of the worst-case spill volume. The total worst-case volume is then the drain-down volume of 90,416 Bbl plus the pumping rate volume of 75,000 Bbl totaling 165,416 Bbl (6.95 million gallons).

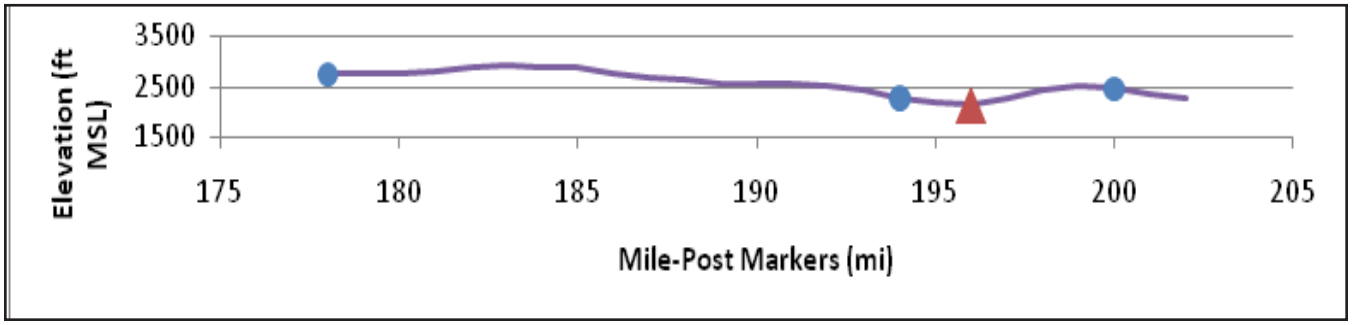

Figure 2: Horizontal profile of surface elevations at the Yellowstone River crossing. Note that the vertical axis is exaggerated compared to the horizontal axis. Solid circles show locations of pipeline valves. The solid triangle shows the location of the river crossing.

Worst-Case Release Volume Calculation for the Platte River, NE

The Keystone XL Pipeline is proposed to cross the Platte River in Nebraska at MP 756.5. There is an upstream valve at MP 747.6 and a downstream valve at MP 765. Figure 3 shows the elevation profile for the crossing at the Platte River. A reasonable worst-case spill scenario is to consider the valve at MP 765 (i.e., closest to the river) to fail. The drain-down volume would then be the pipeline volume between the high point at MP 760 and the valve at MP 747.6. The resulting drain-down volume would be $3.70x10^5$ ft^3 (65,950 Bbl, 2.77 million gallons). Adding the pumping rate volume, the worst-case spill at the Platte River crossing would be 140,950 Bbl (5.92 million gallons).

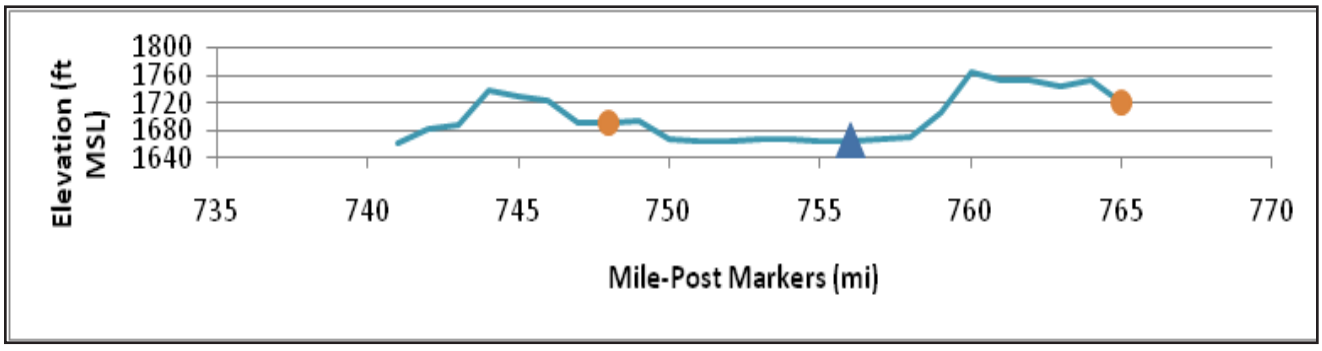

Figure 3: Horizontal profile of surface elevations at the Platte River crossing. Note that the vertical axis is exaggerated compared to the horizontal axis. Solid circles show locations of pipeline valves. The solid triangle shows the location of the river crossing.

013790

Table 3: Worst-Case Spill Volume Estimates.

Location	Estimate from this analysis		
	Pumping Rate Volume (Bbl)	Drain Down Volume (Bbl)	Total Release (Bbl)
Groundwater	189,000[a]	NA	189,000
Missouri River	75,000[b]	47,867[c]	122,867
Yellowstone River	75,000[b]	90,416[c]	165,416
Platte River	75,000[b]	65,950[c]	140,950

(a) 900,000 Bbl/d (Keystone XL design pumping rate)* 1.5percent leak * shut-down time of 14 days

(b) 900,000 Bbl/d (Keystone XL design pumping rate) * shut-down time of 2 hours

(c) Expected volume to drain from ruptured pipeline after pumps and valves closed

Comparison to TransCanada methods

TransCanada calculated the total Worst-Case Release Volume in a way that appears to be flawed. The worst-case volume was calculated from (ERP, 2009):

$$WCV = ALV + PRV$$

Where:

WCV = worst-case volume (Bbl)

ALV = adjusted line volume (Bbl)

PRV = pumping rate volume (Bbl) i.e., pumping rate (Bbl/min) * time to shut-down (min)

The adjusted line volume was calculated from:

$$ALV = (ILFV – PRV) * 0.60$$

Where:

ILFV = initial line fill volume (Bbl) i.e., the volume of the pipe between the leak and the nearest valve on both sides of the leak.

0.60 = drain-down factor where 60 percent of the oil in the pipe will drain after shut-down.

For the Hardisty Pump Station/Regina Pump Station (Keystone pipeline) calculation, the ILFV was stated as 63,346 Bbl. The pumping rate was 662,400 Bbl/day, and the time to shut down was 19 minutes (10 minutes of evaluation of whether a leak had occurred and 9 minutes to shut down the system). This resulted in a PRV of 8,740 Bbl, and an ALV of 32,763 Bbl. The ALV plus the PRV resulted in a total release of 41,503 Bbl.

TransCanada does not explain how the initial line fill volume is calculated. They simply provide a value (ERP, 2009). For the Hardisty Pump Station/Regina Pump Station calculation, they state the value to be 63,346 Bbl. There is no way to verify this value. Whatever method was used, the value should be the pipeline volume between the leak and the high points of elevation on both sides of the leak. TransCanada then, in what appears to be a flawed process, subtracts the pumping rate volume from the initial line fill volume. It is not clear why this subtraction was done. Apparently, TransCanada considered that since the PRV would be pumped out of the pipeline during the leak discovery and shut-down time, that volume of oil would not be still in the pipeline during draining. However, even though the PRV would be removed from the pipeline during shutdown time, an equal amount would be pumped into the draining section. Therefore, the DDV should be calculated as simply the volume of the drain-

013791

ing pipeline modified by the fraction of oil trapped in local low points. That is, the PRV should not have been subtracted from the ILFV. The result of subtracting the PRV from the ILFV was then multiplied by 0.60 to account for 40 percent of the oil in the pipe being caught in locally low spots in the pipeline and failing to drain out. Certainly some of the oil in the pipe will fail to drain, especially in locally low spots; however, considering siphon effects, it is very likely that nearly all of the oil will drain even through the locally low spots. Therefore, the 60 percent drain factor is likely to be a significant underestimate of the fraction of oil that will drain. For this worst case spill analysis, a drainage factor of 80 percent is a more reasonable assumption.

Table 4 shows the PRV, DDV, and total worst-case release estimates for the Hardisty Pumping Station on the original Keystone pipeline using methods recommended in this analysis and methods used by TransCanada (ERP, 2009). Note that the PRV values using the method of this paper are much larger than those using TransCanada's method because the assumed shut-down time is much shorter in TransCanada's method (19 minutes compared to 2 hours). The drain-down volumes used for both methods are the reported drain-down volumes from TransCanada's method because sufficient detail was not available in the TransCanada report (ERP, 2009) to allow a comparison of methods.

Table 4: Worst-Case spill volume estimate using the method recommended in this analysis and the method used by TransCanada for the Keystone Pipeline.

	Estimate from this Paper			TransCanada Estimate[a]		
	PRV (Bbl)	DDV (Bbl)	Total Release (Bbl)	PRV (Bbl)	DDV (Bbl)	Total Release (Bbl)
Hardisty Pumping Station	55,200[b]	32,764[c]	87,964	8,740[d]	32,764[c]	41,504

(a) ERP, 2009

(b) Pumping rate volume = 662,400 Bbl/d (Hardisty) * shut-down time of 2 hours

(c) Drain-down volume reported by TransCanada (ERP, 2009)

(d) Pumping rate = 662,400 Bbl/d * shut-down time of 19 min

Impacts from Worst-Case Spill

Impacts to the Air

The primary impacts to the air will be from benzene, hydrogen sulfide, and light molecular weight constituents of the DilBit. The DilBit will be pumped at high temperatures (up to 158°F) and pressures (up to 1440 psi) causing these compounds to volatilize into the air at the site of the spill. The Occupational Health and Safety Agency (OSHA) acceptable concentration of benzene in the air for a workplace is 3.25 mg/m^3 (NIOSH, 1990) for short-term (8-hour) exposures. Since benzene is denser than air, it could accumulate in low-lying areas that are protected from the wind. Under these conditions, the benzene concentration could be above acceptable levels for inhalation. The basements of buildings located above groundwater plumes could also trap benzene gases that exceed safe levels. This could have serious consequences for the occupants of such a building, who may not be aware that a plume of benzene lies beneath the building.

Hydrogen sulfide is another toxic gas that could cause dangerous conditions at the site. The OSHA acceptable concentration for a workplace is 14 mg/m^3 for an 8-hour exposure and 21 mg/m^3 for even a momentary exposure (NIOSH, 1990). The concentrations of hydrogen sulfide in the air are

013792

expected to be above acceptable levels in areas near a spill site (Enbridge, 2010) and will likely be a serious health threat to emergency workers, remediation workers, and possibly to local residents.

In addition to toxicity effects, benzene, hydrogen sulfide, and the light molecular weight fractions of the oil could create explosive conditions as they volatilize from the spilled oil. Again, this risk will be greatest in areas that are protected from the wind and where concentrations could reach the explosive limits.

Impacts to Terrestrial Resources

The proposed pipeline will cross numerous types of terrestrial habitats (e.g., upland prairies, lowland prairies, woodlands, northern high plains, etc.) as it passes from Canada to Texas. Each of these habitats is unique in terms of its physical conditions (e.g., soils, climates), biological communities, and human communities. Because the physical, biological, and human conditions are so varied in these habitats, the potential impacts from a spill will be different for each type of habitat and location. Therefore, it is not possible to thoroughly assess the potential impacts to terrestrial habitats in this paper.

In general, a primary negative impact caused by a crude oil spill on land will be burial and smothering of plants and ground-dwelling animals. The spilled DilBit will form a very dense and thick layer over the ground that will kill essentially any organisms that are contacted. This effect will be localized to the immediate area of the spill, and most animals will be able to avoid contact with the oil. However, some animals may inadvertently contact the oil (e.g., birds landing in the oil) and be harmed or killed. In addition, the spill will release toxic constituents such as benzene, hydrogen sulfide, light molecular weight oil fractions, and polycyclic aromatic hydrocarbons (PAHs), all of which will have toxic effects on local wildlife. A significant concern arises when the pipeline crosses habitats of the numerous threatened or endangered species that are found along the pipeline route. Finally, the spill could affect human communities via exposures to the toxic constituents.

Impacts to Surface Water Resources

The primary constituents of concern in surface water are: benzene, PAHs, hydrogen sulfide, and bulk crude oil. The amounts of these constituents in the surface water are affected by several factors including: the concentration of the constituent in the crude oil, the solubility of the constituent, and the turbulence and velocity of the water. Constituents of special concern are benzene and certain PAHs because they are carcinogenic.

Benzene makes up 0.1 to 1.0 percent of DilBit crude oil (Shell Canada, 2008), and it is relatively soluble in water. The amount of benzene that will be dissolved in the water can be estimated from the octanol-water partition coefficient (a measure of how much of a contaminant will dissolve into the water) which is 131.8 for benzene (LaGrega et al., 2001). Using the octanol-water relationship, and assuming that the benzene concentration in the DilBit is 1 per cent (~$1x10^4$ mg/L), results in a benzene water concentration immediately at the oil/water interface of 75 mg/L ($1x10^4$ mg/L ÷ 131.8). This benzene concentration is 15,000 times the MCL for benzene of 0.005 mg/L. Since the temperature of the DilBit will be up to 158°F, the actual water concentration at the spill will likely be somewhat higher than this calculation, which is based on an octanol-water partition coefficient for ambient temperatures. The benzene concentration will decrease with distance from the oil/water interface. TransCanada's Risk Assessment calculated that the average (mixed) benzene concentration in surface water for a 10,000 Bbl spill in a 10,000 ft^3/sec stream would be 2.2 mg/L (ENTRIX, 2010); however, this calculated concentration assumes that all of the benzene would be released into the water within one hour (likely over-estimates resulting concentrations) and that the benzene is immediately mixed across the entire stream (under-

013793

estimates resulting concentrations). Note that 2.2 mg/L is 440 times the MCL for benzene. In most cases, the benzene will form a plume that travels downstream from the spill site. The concentration in the plume will gradually decrease as it moves farther from the spill site.

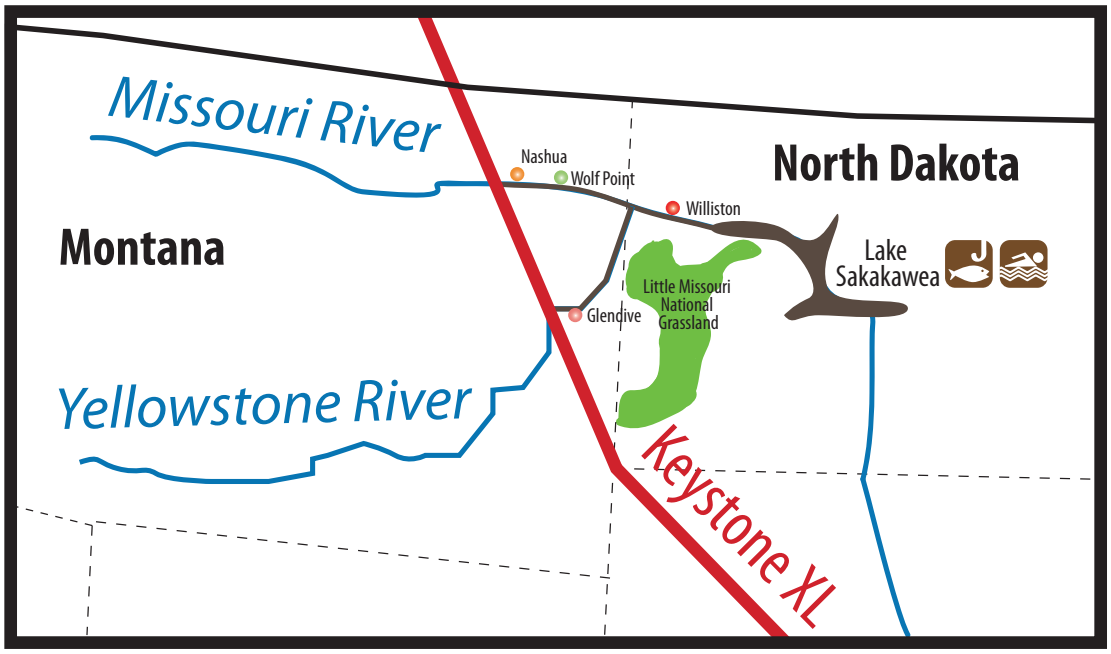
Besides human health risks from contaminated drinking water supplies, benzene also poses risks to aquatic species. The EPA Region III screening water concentration for benzene designed to be protective of aquatic biota is 0.370 mg/L (EPA, 2011b). The predicted benzene concentration at the oil/water interface is 75 mg/L which is 200 times higher than the screening concentration. Therefore, negative ecological impacts due to toxicity are expected, at least in localized areas where benzene is actively dissolving from the oil.

If a spill of 150,000 Bbl (i.e., in the range of predicted worst-case spill volumes) were to occur in a stream with a flow of 10,000 ft^3/sec and a velocity of 3 ft/sec (e.g., the Missouri River below Fort Peck dam has a flow of 9,225 cfs, and the Yellowstone River at Miles City, MT has a flow of 11,180 cfs (USGS, 2009)), the mass and resulting plume of the benzene in the water could be characterized as follows. Assuming that benzene makes up 1.0 percent of the DilBit, 150,000 Bbl of DilBit would contain approximately $2.3x10^5$ Kg of benzene (150,000 Bbl * 42 gal/Bbl * 3.788 L/gal * 1 Kg/L * 0.01). If 80 percent of the benzene is lost via volatilization and product removal during and immediately after the spill, $4.77x10^4$ Kg of benzene would remain in the stream. This benzene would dissolve through time into the water from the DilBit mixture. To be released into the water, the benzene in the mass of crude would have to diffuse to the oil/water interface. Since the composition of DilBit is variable and since the thickness of the crude mass is case-specific (i.e., depends on turbulence, temperature, etc.), it is not possible to predict precisely the rate at which the benzene will diffuse to the oil/water interface; however, a reasonable assumption would be that 5 percent of the benzene would reach the oil/water interface per day. If this assumption is too high, these calculations will over estimate the water concentrations but underestimate the duration of the negative impacts, and if it is too small, the opposite will be true. Assuming 5 percent of the benzene is released into the water per day, over 2.3 million grams of benzene will be released to the water per day. This will result in a water concentration of 0.09 mg/L ($2.3x10^6$ g/d * sec/10,000 ft^3 * 1d/86,400 sec * 1,000 mg/g * 35.3 ft^3/m^3 * 0.001 m^3/L) once the contaminant plume completely mixes across the entire width of the stream (several miles downstream of the spill). This concentration exceeds the MCL of 0.005 mg/L by 18.8 times. As the benzene plume migrates downstream, the concentration will decrease because of processes such as degradation and volatilization. Reported half-lifes of benzene in surface water range from 1 to 6 days (USEPA, 1986). Assuming a half-life of 3 days, a stream velocity of 3 ft/sec, and a tributary contribution of 20 cfs/mi (the measured value for the Missouri River downstream of the proposed crossing (USGS, 2009)), the plume would reach over 450 miles before its concentration would drop to the MCL and be safe for public water intakes. The plume length was modeled using a series of 10-mile long river reaches with first-order decay ($k=-0.231d^{-1}$) and increased flow of 200 cfs/10 mi reach.

Contaminants from a release at the Missouri or Yellowstone River crossing would enter Lake Sakakawea in North Dakota where they would adversely affect drinking water intakes, aquatic wildlife, and recreation. Contaminants from a spill at the Platte River crossing would travel downstream unabated into the Missouri River for several hundred miles affecting drinking water intakes for hundreds of thousands of people (e.g., Lincoln, NE; Omaha, NE; Nebraska City, NE; St. Joseph, MO; Kansas City, MO) as well as aquatic habitats and recreational activities. In addition, other constituents from the spill would pose serious risks to humans and to aquatic species in the river.

013794

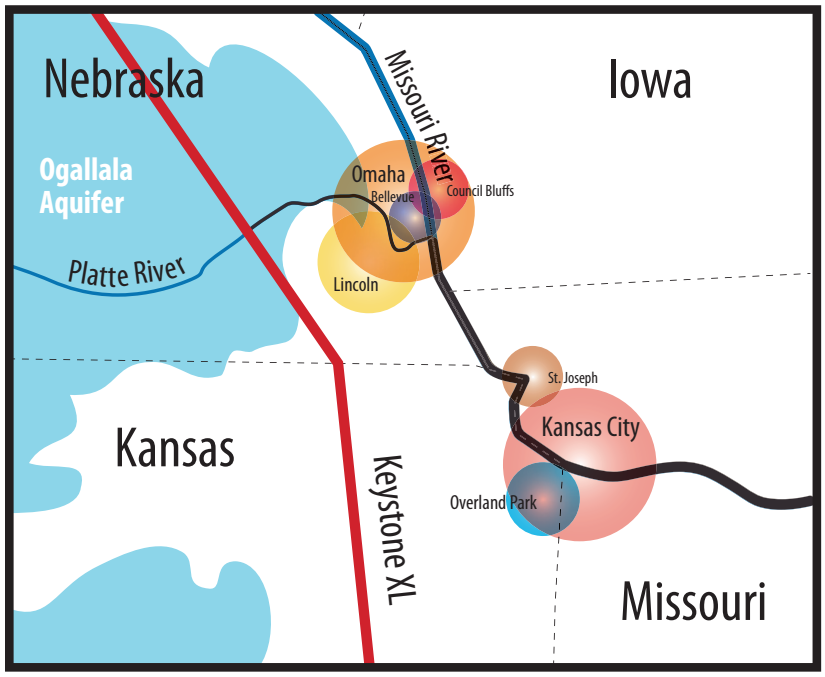
Worst-case spill at the Missouri River or Yellowstone River crossing.



A spill at either crossing could release millions of gallons of crude oil into the rivers and extending downstream as far as Lake Sakakawea, polluting drinking water, and threatening endangered species and recreation areas.

Populations affected by a worst-case spill at the Platte River

- Kansas City - approx. 447K
- Omaha - approx. 420K
- Lincoln - approx. 241K
- Overland Park- approx. 167K
- St. Joseph - approx. 73K
- Council Bluffs - approx. 60K
- Bellevue - approx. 48K



Population estimates based on available data from the U.S. Census Bureau, http://quickfacts.census.gov. Circles representing these cities are for illustrative purposes and are not to scale.

013795

Of course other assumptions (e.g., shorter half-life) would give somewhat different results. For example, assuming that benzene makes up only 0.3 percent of DilBit and that 10 percent of the benzene is released per day, the calculated plume length would be reduced to around 200 miles. However, since the case-specific details are not known at this point, the precise impacts cannot be calculated; however, it has been clearly shown that if a worst-case spill occurs in a major stream, the impacts would be serious, far-reaching, and long-lasting, and claims to the contrary should be challenged.

The concentrations of PAHs (e.g., benz(a)pyrene) are not specified in the Material Safety Data Sheet (MSDS) for DilBit (Shell Canada, 2008). Also, the risk assessment done for the pipeline (ENSR, 2006) discusses the presence of PAHs, but doesn't detail specific concentrations. Therefore, this analysis will assume that PAHs make up 2 percent of DilBit, and that benz(a)pyrene (BaP) makes up one-tenth of the PAHs or 0.2 percent of the DilBit. This is likely an underestimate. PAHs are not as soluble or as mobile in surface water as is benzene. Much of the released PAH mass will sorb to sediments and remain closer to the location of the spill. However, they will be transported downstream with suspended solids and sediments, and the PAH fraction that does dissolve will form a plume and also be transported downstream. Since they are less soluble and mobile than benzene, PAHs pose less of a threat to municipal water intakes. Using the octanol-water coefficient for benz(a)pyrene (BaP) of 1.1×10^6 (LaGrega et al., 2001), the BaP concentration at the oil/water interface would be 0.0018 mg/L (1.8 μg/L). This concentration exceeds the MCL for BaP of 0.0002 mg/L by a factor of about ten; however, this concentration would be quickly reduced as the plume mixes in the stream. Therefore, based on the assumption that PAHs make up 2 percent of the DilBit, drinking water is probably not significantly threatened from release of PAHs.

However, PAHs are toxic to aquatic organisms. The EPA Region III water quality criteria for benz(a)pyrene to protect aquatic species is 0.015 μg/L (EPA, 2011b). In addition, there are several other PAHs with water quality values to protect aquatic species (e.g., benzo(a)anthracene (0.018 μg/L), fluoranthene (0.04 μg/L), and naphthalene (1.1 µg/L)) that are likely to have concentrations that exceed water quality criteria in a major spill. Therefore, the estimated concentration of PAHs is approximately 100 times the allowable level for protection of aquatic life.

Hydrogen sulfide is very volatile, and much of it will likely volatilize to the air during a major spill. However, some of the hydrogen sulfide will dissolve into the surface water and cause toxic effects to the aquatic biota. The EPA Region III screening water concentration protective of aquatic species is 2.0 μg/L. Since the hydrogen sulfide will quickly volatilize, it is expected that these toxic effects will be limited to areas near the spill.

Bitumen, which makes up most of the DilBit, is more dense than water, so it will sink to the bottom and smother any aquatic plants or sediment-dwelling organisms. These effects will be limited to the immediate area of the spill and are expected to pose a significant risk primarily if the stream is the habitat to threatened or endangered species. Since the Missouri, Yellowstone, and Platte Rivers all provide habitat to threatened and endangered species, including the pallid sturgeon, interior least tern, and piping plover, these impacts should be considered potentially significant.

Table 5: Benzene Plume Development for Spill of 150,000 Bbl into a 10,000 cfs Stream.

	Estimate From This Analysis
Spill Volume	150,000 Bbl
Stream Discharge	10,000 cfs
Fully Mixed Concentration[(a)]	0.09 mg/L

013796

Ratio of Concentration to MCL [b]	18.8
Length of Plume > MCL [c]	450 miles
Duration of Release to Water [d]	20 days

(a) mg/sec benzene release to stream ÷ L/sec of flow (10,000 cfs = 283,286 L/sec)

(b) fully mixed concentration ÷ 0.005 mg/L

(c) assumes half-life of 3 d; velocity of 3 ft/sec;

(d) assumes 5 percent of benzene is released from DilBit mass per day

Impacts to Groundwater Resources

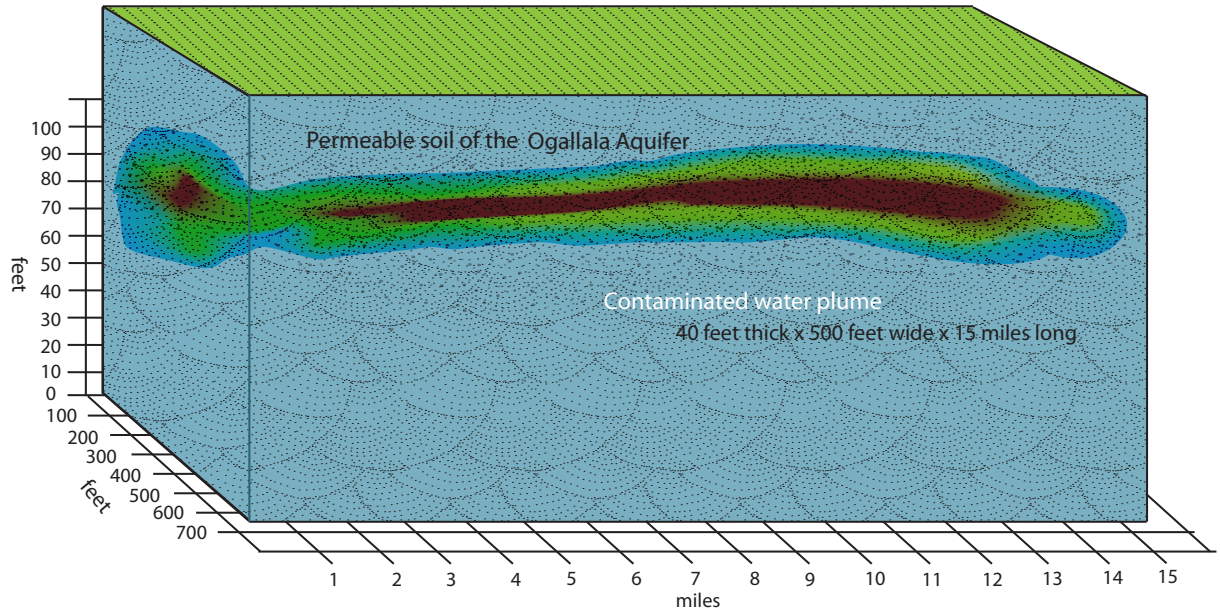
The primary constituent of concern for a spill into groundwater is benzene. Since DilBit is very viscous, the bulk crude oil will not likely migrate through the soil to groundwater in large quantities. However, if a small, underground leak remains undetected for an extended period of time, a large amount of benzene will be released with the DilBit. The released benzene could then be transported to groundwater via infiltrating rainwater. According to a TransCanada publication "Frequency-Volume Study of Keystone Pipeline" (DNV, 2006), a leak of 1.5 percent of total flow could remain undetected for 90 days. For this analysis, the discovery and shut-down time is assumed to be 14 days which corresponds to the time between pipeline inspections. At the design flow rate of 900,000 Bbl/d, a 1.5 percent leak would release 189,000 Bbl (7.9 million gallons) of DilBit in 14 days. Since DilBit is 0.1 to 1.0 percent benzene, this would result in a release of up to 79,380 gallons of benzene.

A spill of the magnitude of 189,000 Bbl of DilBit would occupy approximately 2.65×10^6 cubic feet of subsurface sands with a porosity of 0.4 (189,000 Bbl * 5.61 ft^3/Bbl ÷ 0.4). Assuming that the DilBit mass occupies a somewhat cylindrical volume and that the aquifer is 20 feet below the pipeline, the DilBit would spread to an area approximately 335 feet in diameter (335 feet diameter X 30 feet high). A reasonable worst-case 100-year, 24-hour storm would deposit 6 inches of rain water on the site. In the Sandhills of Nebraska, nearly all of this water would infiltrate. Six inches of water infiltrating onto a contaminated area of 8.8×10^4 ft^2 (335 feet diameter) results in 4.4×10^4 cubic feet of water (8.8×10^4 ft^2 * 0.5 ft infiltrating water) contacting the DilBit. Using the octanol-water partition coefficient of 131.8 (LaGrega et al., 2001), the benzene concentration in the infiltrating water would be approximately 75 mg/L. The 4.4×10^4 cubic feet of water at a concentration of 75 mg/L equates to 9.35×10^7 milligrams of benzene. Thus, this storm would transport 9.35×10^7milligrams of benzene to the groundwater. Once in the groundwater, the benzene plume would migrate down-gradient, potentially to down-gradient water supplies or basements where it could pose a cancer risk to residents. The 9.35×10^7milligrams of benzene in the groundwater, if evenly distributed (not likely) could pollute 1.9×10^{10} L (4.9×10^9 gallons) of groundwater at the MCL, enough water to form a plume 40 feet thick by 500 feet wide by more than 15 miles long (assuming porosity of 0.4) at the MCL. These plume dimensions are given for illustrative purposes only. The actual dimensions of a groundwater plume cannot be determined with the available information. Of course, the benzene would not be evenly distributed; however, the plume would still be many miles long. In addition, future storms would transport additional benzene to the groundwater increasing the size of the plume.

The worst-case site for such a spill is in the Sandhills region of Nebraska. The Sandhills are ancient sand dunes that have been stabilized by grasses. Because of their very permeable geology, nearly 100 percent of the annual rainfall infiltrates to a very shallow aquifer, often less than 20 feet below the surface. This aquifer is the well-known Ogallala Aquifer that is one of the most productive and important aquifers in the world.

013797

Worst-case spill above the Nebraska Sandhills.



A spill over 14 days, releasing 7.9 million gallons of crude oil could contaminate 4.9 billion gallons of water and form a plume 40 feet thick by 500 feet wide by 15 miles long. By comparison:

The length of the plume is equal to 264 football fields.
Manhattan is 13.4 miles long.
The volume of the plume (1,584,000,000 feet^3) is equal to that of 19,631 Olympic sized pools.

Table 6: Benzene Plume from a189,000 Bbl Spill to Groundwater.

Volume of released DilBit (Bbl)	189,000
Volume of benzene in spill (gal)	79,380
Mass of benzene dissolved in groundwater (mg)	9.35×10^7
Volume of contaminated water > MCL (gal)	4.9×10^9
Equivalent plume dimensions	40 feet X 500 feet X 15 miles

The attached report, "**Analysis of Frequency, Magnitude and Consequence of Worst-Case Spills from the Proposed Keystone XL Pipeline", was written solely by Dr. John Stansbury who is solely responsible for its contents. Dr. Stansbury is employed by the University of Nebraska, but the report** does not represent the opinion or views of the University or the UNL Water Center.

The purpose of the report is to provide decision-makers (e.g., State Legislators, Congressmen, State Department representatives) an independent and unbiased assessment, based on available data, of the magnitude and impacts of potential worst-case spills from the Keystone XL pipeline. The intended use of this report is neither to lobby for or against the proposed pipeline. Rather it is intended to provide unbiased information to decision-makers to assist them in making informed decisions regarding the pipeline.

Any questions or comments regarding this report should be directed to Dr. Stansbury (jstansbury2@unl.edu).

Disclaimer

This final report summarizes the results of work performed by Exponent representing the "Environmental Review" of the Keystone XL Project Risk Assessment (Appendix P of FEIS) and related sections in the Final Environmental Impact Statement (FEIS). This work represents a limited and directed scope of review focused specifically on the Risk Assessment (Appendix P of FEIS) and on specific questions addressed to Exponent as detailed in Section 1 of our report. The findings presented herein are made to a reasonable degree of scientific certainty based on information and data provided by the U.S. Government (i.e., DOS/PHMSA/EPA), through the U.S. Department of State (DOS) and by TransCanada Keystone Pipeline, LP (Keystone). Limited data gathering was involved. Exponent reserves the right to supplement this report and to expand or modify findings and opinions based on our review of additional material as it becomes available through ongoing correspondence with DOS/PHMSA/EPA and Keystone and/or through any additional work or review of additional work performed by Battelle and others. Also, due to the limited and directed scope of this review, this report shall not be considered to have identified or analyzed all scenarios and all sensitive resources that could potentially be impacted by the Keystone XL Project. In our review we point out the limitations of work conducted previously by others. To the extent that we have conducted analyses to address the questions posed to us, these analyses represent very limited and time-constrained analyses, and therefore cannot and should not be construed as filling gaps or inadequacies. In particular we recognize that Keystone will undertake a more detailed analysis to address questions related to the final design of the Keystone XL Project and the potential for environmental impacts. Determining the adequacy of the Biological Assessment performed as part of the FEIS in regard to threatened and endangered species and other special status species is outside Exponent's scope of work as determined by DOS. Rather Exponent used the information in the FEIS on special status species in support of our review. The report addresses comments on Exponent's draft report. Exponent's review was based on the initial route for the pipeline; the modifications of that route have not been specifically evaluated. However, the general recommendations made in this report are broadly applicable.

Executive Summary

This report provides Exponent's third-party independent environmental review of a specific set of issues identified by the U.S. Department of State (DOS) in consultation with the U.S. Department of Transportation, Pipeline and Hazardous Materials Safety Administration (PHMSA) and the U.S. Environmental Protection Agency (the agencies) that relate to the Keystone XL Project (Project) preliminary risk assessment (Risk Assessment) prepared by AECOM and Dynamic Risk Assessment Systems, Inc., on behalf of TransCanada Keystone Pipeline, LP (Keystone). These issues are described in Section 1 of our environmental review. The Risk Assessment document is presented in Appendix P–*Pipeline Risk Assessment and Environmental Consequence Analysis* dated July 2009 contained within the Final Environmental Impact Statement (FEIS) prepared for DOS by Cardno ENTRIX, contractor for DOS. The agencies thought it advisable to have an additional environmental review of the Risk Assessment because of the highly technical nature of the issues involved, and the desire to ensure that the Project-specific Special Conditions are properly implemented in the event that a Presidential Permit is issued. To address the issues identified by the agencies, we relied on information in the Risk Assessment and FEIS as well as information we obtained that related to the issues identified by the agencies. The report addresses comments on Exponent's draft report. Exponent's review was based on the initial route for the pipeline; the modifications of that route have not been specifically evaluated. However, the general recommendations made in this report are broadly applicable.

The agencies determined that Keystone should commission an engineering analysis that would, at a minimum, assess the advisability of additional valves and/or the deployment of external leak detection systems in areas of particularly sensitive environmental resources. Battelle was chosen by the agencies to provide that ***engineering review***. Exponent was tasked by the agencies to provide the ***environmental review***, part of which was to consider the presence of other sensitive environmental resources along the Project that may warrant additional environmental protection. These potentially sensitive environmental resources were in addition to those that had been the focus of the Risk Assessment. Based on the Scope of Work described in Section 1 of this environmental review, Exponent performed the following tasks:

1. Provided an overview of the overall Keystone Risk Assessment methodology
2. Examined the characteristics of the crude oil being transported
3. Evaluated transport and fate characteristics of spilled crude oil
4. Addressed sensitive issue Area 1: Shallow groundwater
5. Addressed sensitive issue Area 2: Small stream crossings less than 100 ft in width and associated ecological concerns.

This executive summary provides a brief overview of each of these tasks, along with our key findings and recommendations. Exponent's findings will be used, in part, by Battelle to make recommendations related to engineering considerations that could be used to address environmental safety issues related to the Project.

Review of Crude Oil Composition

Exponent reviewed Keystone's consideration of the chemical and physical characteristics of the oil blends to be transported in the pipeline, and compiled crude oil compositional data required in the subsequent sections of our report. Exponent compared the characteristics of diluted bitumen (dilbit) and synthetic crude oil (SCO) to typical crude oil using data from a number of publically available sources.

Key Findings/Conclusions

- The physical and chemical characteristics of dilbit are consistent with a heavy crude oil
- The physical and chemical characteristic of SCO are consistent with a medium gravity crude oil
- The benzene concentrations of both oils are within the range of typical crude oils
- The chemical compositions of the oils are within the range of typical crude oils, although there are some significant gaps in our knowledge about all the constituents
- For the factors considered by Keystone in the Risk Assessment, we agree with their conclusion that dilbit and SCO are sufficiently similar to crude oil and that they should not result in an excess risk in case of a release.

Recommendations

- While not required at this stage in the process, Keystone should consider obtaining additional information on the chemistry of the oils as this information will be needed for developing clean-up and remediation plans
- Knowledge on the chemistry of dilbit continues to increase, and that new information should be incorporated into planning and operations as appropriate (e.g., to improve spill response planning).

Transport and Fate of Spilled Oil

To address questions about potential environmental consequences of oil spills raised by the agencies, Exponent conducted additional transport and fate analyses to better describe the

behavior of potential spills. Our review relied on information provided in the Risk Assessment and FEIS as well as on information and data in the scientific literature such as the viscosity of the oil and distance that oil spills have been known to travel in surface water. We conducted screening-level calculations to quantitatively check statements made in the Risk Assessment about the behavior of oil spills, and to support other aspects of our evaluation.

Our evaluation of possible risks to sensitive areas of groundwater and surface waters depends in part on how the spilled oil will behave when released from a buried pipeline. Therefore, we evaluated how quickly large and small spills might reach aquifers and the behavior of dissolved constituents in these aquifers. Our screening calculations are not an exhaustive transport and fate analysis. The detailed analyses that are required by Special Condition 14 and PHMSA regulations, as part of the Integrity Management Program, will be conducted after the final route is selected as part of the final design of the project. The rate of migration of an oil spill to and in groundwater is an important consideration in the development of the Environmental Response Plan (ERP). It bears directly on response time and the ability to contain and clean up spills that might occur. Similarly, the distance that oil spilled into surface waters of small streams could travel is important for identifying ecologically sensitive areas or other high consequence areas (HCAs) that might be impacted.

Quantitative screening-level estimates of the potential transport of oil to groundwater are provided for two scenarios: a large volume spill or rupture, and a small leak. We also provide a discussion on the potential transport of oil overland. Exponent's analyses are based on the general range of conservative conditions and are intended to provide a sense of scale of potential oil impact. Thus, findings are expected to be a conservative characterization of what could happen along the pipeline. Based on these analyses, Exponent considered the ramifications of the findings in light of the implications they would have on the final Project design and ERP. The following are Exponent's key findings/ conclusions, followed by our recommendations.

Key Findings/Conclusions

- The flow of oil overland is affected by many variables including spill rate, topography, soil type, and vegetation. To provide a sense of scale, a highly simplified case of a sudden spill of 25,000 bbl to a flat surface is presented. If the spill flows in a radial pattern, is 1 ft deep, and there is no spill response, it would spread with a radius of about 200 ft. A pool with a depth of 0.1 ft would spread to a radius of about 700 ft. If a surface spill was influenced by topography and flowed in a channelized manner, the distance traveled could be on the order of thousands of feet, depending on the steepness of the terrain, presence of vegetation, etc. Keystone conservatively assumed in the Risk Assessment that a large spill would be capable of moving overland up to 1 mile. Therefore, considering our analyses, the 1 mile distance criterion used in the Risk Assessment is considered adequate. Where HCAs are located within 1 mile of the pipeline, Keystone is required to perform a site-specific evaluation of overland flow (spreading analysis).

- Exponent applied a numerical screening model, the hydrocarbon spill screening model or HSSM, to estimate the behavior of a large spill of dilbit from the pipeline in an area with a high permeability shallow aquifer. The HSSM modeling simulation showed that groundwater impacts from a large spill would likely occur first from infiltration from the trench near the rupture and not from oil spread across the ground surface. Oil in the potentially filled trench near the rupture could begin forming a non-aqueous phase liquid lens at the water table in less than 1 day if the water table is 1 ft below the trench (8 ft below ground surface), in 7 days if the water table is 3 ft below the trench (10 ft below ground surface), and in 50 days if the water table is 10 ft below the trench (17 ft below ground surface). In contrast, oil infiltrating from the ground surface would reach a water table 8 ft below ground surface after approximately 240 days.

- Results from HSSM simulations of a large spill (25,000 bbl) illustrate that plume lengths for dissolved hydrocarbons (i.e., benzene at or above the under typical groundwater gradients could be between 100 and 900 ft in length. This range is consistent with those reported in the literature; most reported plumes are less than 200–300 ft and a very small number of plumes exceed 1,000 ft. HSSM simulations were also performed to explore an elevated groundwater gradient, representing the potential influence of groundwater extraction (irrigation wells) near the pipeline. When coupled with a simulated low degradation rate (representing an upper bound condition), the higher groundwater gradient could extend the plume length to as much as 2,600 ft.

- Modeling results agree with the conclusions in the Risk Assessment that a small leak going undetected indefinitely is unlikely. More likely, oil from a small "pin hole" leak (28 bbl/day) would reach the ground surface on a time scale of a few months. Based on the screening-level modeling, a benzene plume that may form because of a small leak was estimated to travel downgradient by as much as 600 ft.

- Many private wells located near the pipeline do not meet the criteria to be classified as HCAs in the Risk Assessment. Exponent considered potential factors that could be used to identify non-HCA groundwater areas for shallow groundwater (< 50 ft) where more extensive spill prevention measures and monitoring may be warranted. Based on our analysis of possible plume dimensions, we selected a downgradient distance of 1,000 ft from the proposed centerline of the pipeline as a reasonable boundary of a plume for identifying shallow groundwater and associated wells that could be within the influence of an oil spill. This distance recognizes that large spills would be readily detected and remediated and that small leaks that could take longer to be detected would have smaller plumes. Based on an independent review of the NEDNR well database in Nebraska, Exponent identified approximately 260 wells (not screened by depth) within 1,000 ft of the proposed centerline of the pipeline. Most of these wells are used for irrigation purposes but

domestic wells are also present, several of which draw from shallow groundwater. This list will need to be revised once the final pipeline is determined.

- The relative vulnerability/sensitivity of groundwater resources to a dissolved hydrocarbon plume from an oil spill can be assessed by considering combinations of several factors: 1) proximity to the pipeline (<1,000 ft); 2) depth from point of the oil release to the water table (e.g., release of oil at or below the water table will affect groundwater quality more quickly than releases many feet above the water table); 3) depths of receptor wells (wells that are tens of feet deep are more vulnerable than wells that are hundreds of feet deep); and 4) the pumping of receptor wells (wells with higher pumping rates are more likely to draw plumes further downgradient than wells with lower pumping rates). This combination of factors could be used to identify groundwater resources that do not meet the listing criteria for HCAs but may be more vulnerable to a dissolved benzene plume emanating from an oil spill. An example of this would be a cluster of irrigation wells and domestic wells located within 1,000 ft of a pipeline segment where a release of oil occurred in or within a few feet of the water table.

- The assessment in the FEIS conservatively assumes that in the event of a worst-case spill in which all of the benzene partitions from the oil into water in streams with a range of flow rates. The assessment is useful for comparison of worst-case benzene concentrations to human health and ecological concentration benchmarks and is discussed further in Section 5 of our review. However, the FEIS does not provide an evaluation of possible transport distances of oil via surface water. This appears to be a gap that needs to be addressed.

- The primarily qualitative assessment of the transport and fate of oil in the event of a spill presented in the Risk Assessment is consistent with our analysis and review of the literature. Ultimately, quantitative analysis of transport and fate in surface waters is required by Special Condition 14 and PHMSA regulations as part of the Integrity Management Program during the final design of the project after the final route is selected. These evaluations should take into account the lessons learned from the pipeline rupture in Enbridge, Michigan, in 2010.

Recommendations

- Keystone, as part of the final Project design, should perform further evaluation of overland flow (spreading analysis) of spilled oil, and further evaluation of the transport of spilled oil in small streams (e.g., the downstream distance crude oil could travel from the proposed centerline of the pipeline) for purposes of ERP. These analyses should take into account potential density and viscosity increases associated with the loss of volatiles from heavy crudes and diluted bitumen.

- Keystone should use the screening criteria (e.g., well depth, depth of release compared to water table, lithology between pipeline and aquifer) suggested in our report for identifying vulnerable/sensitive groundwater resources adjacent to the pipeline that do not classify as HCAs but that may be more vulnerable to exposure to a benzene plume in the event of a an oil spill. For example, these could be defined as clusters of both domestic and irrigation wells within 1,000 ft of a pipeline segment where an oil spill could occur in or within a few feet of the water table. Exponent recommends that additional modeling be performed as part of the final design of the Project to further refine the appropriate downgradient distance criteria to be used for identifying sensitive clusters of wells. Exponent recommends that these non-HCA groundwater resources be afforded a degree of protection from the occurrence of an oil spill and from the consequences of a spill similar to what is currently afforded to groundwater resources that are defined HCAs.

- Considering the above-mentioned screening analysis, Exponent recommends that Keystone consider how to improve upon external leak detection through more frequent inspections and education of property owners for wells within these areas of sensitive groundwater resources.

Analysis of Risks Related to Small Stream Crossings

Exponent was asked to evaluate whether there are sensitive environments associated with stream crossings that are less than 100 ft wide that may warrant additional analyses and perhaps mitigation or control measures. Exponent used a set of ecologically-relevant criteria to identify such areas. This part of the environmental review also included an examination of information in the FEIS related to special status species, in particular, the presence of these species and their habitats relative to small stream crossings.

As part of our small stream crossing evaluation Exponent performed the following tasks:

- Reviewed the adequacy of the risk characterization of PHMSA-defined HCAs in the Risk Assessment with a specific focus on ecologically sensitive areas (ESAs)

- Evaluated whether there were other sensitive environmental resources downstream of small stream crossings not already identified by the PHMSA-defined ESAs

- Evaluated the adequacy of relying on benzene as a surrogate chemical to address the magnitude of aquatic toxicity of crude oil spilled into small streams

- Evaluated whether the Risk Assessment process adequately considered the presence of special status species (e.g., threatened and endangered species) when defining sensitive ecological resources.

Exponent considered the implications of our findings with respect to the final Project design and ERP. The following are Exponent's key findings/conclusions, followed by our recommendations.

Key Findings/Conclusions

- The Risk Assessment appropriately followed standard PHMSA guidelines for identifying contributory pipeline segments (CPSs) associated with small stream crossings and the HCAs potentially affected.

- Based on our assessment of transport and fate of oil into surface waters, we used a downstream distance of 10 miles as a basis for identifying locations of sensitive areas around small stream crossings. Using a set of ecologically-relevant criteria, Exponent identified at least ten small stream crossings areas that should be considered for additional protection. An additional four small stream crossings were identified as having special water bodies within 10 miles downstream of the proposed centerline of the pipeline that likely have high wildlife habitat value which should also be given further consideration.

- Exponent agrees with the assessment of the potential magnitude of risk of an oil spill on aquatic life in the water column associated with the toxicity of dissolved oil as represented by benzene. While the toxicity assessment based on benzene is not rigorous, it appears to be sufficiently conservative for assessing short-term effects to aquatic biota residing in the water column. However, depending upon the characteristics of the water body into which a spill occurs, some portion of the spilled oil could come into contact with sediments along shorelines or the bottom of the water body. The oil and associated chemicals that may be present within sediments could exert longer-term chronic effects on aquatic biota that are not captured by considering benzene alone.

- Exponent determined that the list of special status species identified in the FEIS is comprehensive and complete. Exponent also found that the preliminary findings of which species are likely to be adversely affected (one species, the American burying beetle) were arrived at through a sufficiently rigorous review of the distribution, abundance, and biological use of the Project area by special status species.

- Exponent believes that there could be habitat utilized now or in the future by special status species that is not specifically identified as PHMSA-designated ESAs.

- Exponent believes ongoing natural shifts in resources underpinning the distribution and abundance of special status species and the species they rely upon will likely result in a shifting of locations where special status species occur during the lifetime of the Project. These changes will necessitate that

the environmental protection of the areas which these species use as habitat along the pipeline corridor be updated over time.

Recommendations

- A distance of at least 10 miles downstream from the proposed centerline of the pipeline should be used for the identification of sensitive areas and for identifying CPSs during the final design phase of the Project.
- Based on location-specific analyses of fate and effects of spills that Keystone will undertake prior to construction, Keystone should consider the use of additional valves and/or noninvasive boring technologies at the small stream crossings that Exponent identified as associated with additional potentially sensitive ecological areas, and where Keystone's release analysis shows the potential exists for medium to very large spills.
- Keystone should rely upon stream-specific scour analyses for small stream crossings to identify where the pipeline should be buried deeper than 5 ft or where horizontal directional drilling may be warranted. The particular small stream crossings identified by Exponent should be given attention in this regard.
- Exponent recommends that the ERP consider the possibility that spilled oil may be entrained into sediments and that these types of conditions be anticipated as part of spill response and clean-up.
- Exponent recommends that the ERP also take into account the additional ecologically sensitive resources identified in our review. For example, wildlife habitat for special status species, within close proximity of the pipeline could be designated as "special and/or unique areas" for purposes of the ERP.
- Exponent recommends that Keystone develop explicit plans for updating the status and presence of special status species and their habitat every 2 years, and that identified changes be incorporated into the ERP.

1 Introduction

This report provides Exponent's third-party independent environmental review[1] of a specific set of issues identified by the U.S. Department of State (DOS) in consultation with the U.S. Department of Transportation, Pipeline and Hazardous Materials Safety Administration (PHMSA) and the U.S. Environmental Protection Agency (EPA) (the agencies) that relate to the Keystone XL Project (Project) preliminary risk assessment (Risk Assessment) prepared by AECOM and Dynamic Risk Assessment Systems, Inc., on behalf of TransCanada Keystone Pipeline, LP (Keystone). This Risk Assessment document is presented in Appendix P–*Pipeline Risk Assessment and Environmental Consequence Analysis* dated July 2009 contained within the Final Environmental Impact Statement (FEIS) prepared for DOS by Cardno ENTRIX, contractor for DOS. The agencies thought it advisable to have an additional environmental review of the Risk Assessment because of the highly technical nature of the issues involved, and the desire to ensure that the Project-specific Special Conditions are properly implemented in the event that a Presidential Permit is issued. To address the issues identified by the agencies, we relied on information in the Risk Assessment and FEIS as well as information we obtained that related to the issues identified by the agencies. The report addresses comments on Exponent's draft report. Exponent's review was based on the initial route for the pipeline; the modifications of that route have not been specifically evaluated. However, the general recommendations made in this report are broadly applicable.

The agencies determined that Keystone should commission an engineering analysis that would, at a minimum, assess the advisability of additional valves and/or the deployment of external leak detection systems in areas of particularly sensitive environmental resources. Battelle was chosen by the agencies to provide that ***engineering review***. Exponent was tasked by the agencies to provide the ***environmental review***, part of which was to consider the presence of other sensitive environmental resources along the Project that may warrant additional environmental protection via mitigation methods such as the use of valves to control spills. These potentially sensitive environmental resources were in addition to those that had been the focus of the Risk Assessment. The Scope of Work provided to Exponent[2] described our tasks as follows:

> *Potentially Sensitive Environmental Resources*
>
> With respect to the identification of particularly sensitive environmental resources, the risk assessment (Note: we refer to our work as an environmental review) should draw from the information included in the final Environmental Impact Statement regarding the potentially affected environment.

[1] Because many assessment terms are used throughout this document, we refer to the Exponent work as an ***environmental review*** to distinguish our work from the Risk Assessment and from the FEIS.

[2] Keystone Project (US) Supply Agreement – Consulting Services Agreement No. 9646 for Keystone –Phase 3&4 Environmental Review dated September 6, 2001 between TransCanada Keystone Pipeline, LP by its agent TC Oil Pipeline Operations Inc., and Exponent, Inc. Schedule A Scope of Work.

The risk assessment (i.e., environmental review) should take into consideration the fact that the focus of 49 CFR 195.6(2) and (3) is to protect particularly sensitive drinking water resources; especially sensitive drinking water resources that have no adequate alternative water supply and whose intakes lie within highly vulnerable aquifers. The identification of sensitive environmental resources, however, should not be limited by those existing code requirements. Rather it should also be informed by the information, analysis, and federal, state, and public input developed through the EIS process.

In light of the information, analysis, and public input received, the examination of sensitive environmental resources should focus on areas of shallow groundwater (defined as a depth to water of less than 50 feet below ground surface), and river crossings less than 100 feet with the presence of sensitive resources. These areas can be identified based on information in the final EIS.

The analysis of potentially sensitive environmental resources should also take account of the particular characteristics of the crude oil likely to be released into the environment in the event of a spill, particularly into an aquatic environment. This should include any specific characteristics that may affect the fate and transport of potential contaminants in the aquatic environment and/or affecting the difficulty of emergency response operations, containment, oil recovery, and remediation efforts. This information would be used to enhance and inform decisions on the DOT response plan(s) for the pipeline if a Presidential Permit were granted.

Exponent's scope does not involve an environmental review of the overall National Environmental Policy Act (NEPA) process as it was carried out for the Project, nor does it provide an independent review of the selected route for the pipeline. The main aspect considered in our environmental review was the potential for the pipeline to impact sensitive environmental resources that border the Project route described in the FEIS and in the Risk Assessment. To carry out our assessment we undertook several tasks, which are described below along with the rationale for undertaking them to meet the objectives of our scope.

1. **Provide Overview of the Overall Keystone Risk Assessment Methodology.** This task was carried out so Exponent would have the necessary understanding of how risks were evaluated and to provide the foundation for identifying other environments that may be sensitive, in addition to those that were explicitly considered in the Risk Assessment and FEIS, as performed by others. The Risk Assessment method used for the Project has been utilized in other pipeline risk assessments and has evolved over the last decade. However, there is no "standard" risk assessment method prescribed by PHMSA. Therefore, in line with Exponent's specific scope of work, our environmental review specifically evaluates the thoroughness of the methodology used in the Risk Assessment to identify potentially sensitive environmental resources (e.g., drinking water aquifer, sensitive ecological resources such as special status species [federal or state-listed as threatened, endangered, proposed or candidate species, BLM

sensitive species, or species of conservation concern]) that have been designated to be considered for additional protection in the event of a spill.

2. **Examine the Characteristics of the Crude Oil Being Transported.** An understanding of the characteristics of the crude oil is essential for evaluating the transport, fate, and effects of this crude in the event of a spill. Therefore, Exponent reviewed these characteristics, as utilized in the Risk Assessment and FEIS and supplemented those evaluations with information from our independent evaluation of the literature. This information was used to support other tasks.

3. **Evaluate Transport and Fate Characteristics**. We examined transport and fate characteristics of spilled crude to evaluate how these spills might affect sensitive environmental resources (e.g., drinking water aquifers and ecological sensitive resources). We focused on larger spills as well as smaller spills that may be below the capability of the Project system for leak detection[3]. We relied upon information provided in the Risk Assessment as well as empirical data reported in the literature. To check certain presumptions about transport, screening-level modeling was carried out to assess the behavior of the spilled oil with respect to transport to and within groundwater, expression at the ground surface, spreading upon the ground surface, and transport in surface water.

4. **Address Sensitive Issue Area 1: Shallow Groundwater.** This task involved an environmental review of the methodology used in the Risk Assessment to evaluate risk to shallow groundwater resources. The agencies raised questions concerning whether there are non-HCA areas that could be particularly sensitive to groundwater contamination and that might warrant additional protection beyond that being planned.

   This task included an evaluation of the spill and transport and fate components of the Risk Assessment with respect to consequences of spills along the pipeline overlying the aquifers. We understand that the context for this particular task is that the Risk Assessment focused mainly on defined HCAs. However, the agencies also expressed a concern about: a) water withdrawal locations that are not defined HCAs (e.g., water withdrawals for agricultural purposes from areas that are not HCAs); b) the possibility that a spill at distance from an HCA or other sensitive area could spread quickly through the aquifer and contaminate the identified HCA or other sensitive area; and c) the issue of future groundwater resources.

[3] Larger spills were considered as 25,000 bbl spills, which is the maximum estimated spill volume according to the Updated Analysis of Incident Frequencies and Spill Volumes for Environmental Consequence Estimation for the Keystone XL Project, October 2011; p. A-12, Figure A-2. Smaller spills were estimated based on simulations of infiltration of diluted bitumen in permeable sand, which provided estimates for detection times and potential spill volumes (see Section 4).

5. **Address Sensitive Issue Area 2: Stream Crossings Less Than 100 Ft in Width and Associated Ecological Concerns.** While there are regulatory requirements and specified mitigation and control measures specified in the FEIS for river crossings in excess of 100 ft, we were asked to examine the environmental risk and need for any additional mitigation measures for small stream crossings that are less than 100 ft. For these smaller stream crossings, the pipe will be buried to at least 5 ft, but would not necessarily include valves for limiting spillage into the stream. We evaluated the available information to assess whether there were sensitive environments associated with small stream crossings that are less than 100 ft wide that may warrant additional protection. Related to this issues, we also reviewed information on the aquatic toxicity of constituents in the crude as a check on the assessment made in the Risk Assessment of the potential effects of an oil spill to a surface water body. This part of the environmental review also included an examination of information in the FEIS related to special status species, in particular, the presence of these species and their habitats relative to small stream crossings.

   We also commented on how special status species and their habitats might change over the operational history of the pipeline, and how those changes might alter their risk of exposure to potential spills. We provided suggestions for how these changes could be addressed during the lifetime of the pipeline.

To carry out these five tasks, Exponent scientists were organized into teams that addressed each specific topic. The teams shared their evaluation results throughout the process. Our scientists relied mainly on information provided in the Risk Assessment, the FEIS, and on supplemental information provided directly by Keystone. However, we also searched for and accessed relevant publically available information and utilized that information in our evaluation. Numerous questions arose during the course of our evaluation and we relied upon daily calls with Keystone, the agencies, and Battelle to identify additional information and provide the information necessary to help answer these questions. We also held a series of calls with Battelle to coordinate our effort with theirs and to obtain and share information from our respective assessments.

The Exponent environmental review team is described below.

1.1 Exponent Environmental Review Team Roles and Members

The Exponent environmental review team is presented below by role. Brief resumes for the environmental review team members can be found in Appendix A. Specific technical environmental review teams were formed to review the following in more detail:
1) characteristics of crude oil including physical, chemical, and toxicology properties;
2) transport and fate of crude oil as it relates to impacts to groundwater and surface water;

3) small stream crossings in regard to the presence of ecologically sensitive areas (ESAs) associated with them, and 4) special status species considerations related to the Project.

Overall Management

Charles Menzie, Ph.D. (Project Manager)

Special Status Species Evaluations Team

Richard Podolsky, Ph.D. (Team Leader)
Jane Ma, Ph.D.
Ashley Kaiser, M.S.

2 Risk Assessment Methodology Description

This section presents a description, not a critique, of the Risk Assessment methodology and provides a road map for what portions of the Risk Assessment Exponent and Battelle are reviewing in detail. Areas where Exponent is performing additional evaluations in support of our environmental review are discussed briefly in this section. The detailed evaluations used to support our environmental review are provided in subsequent sections of this report.

In general, the risk assessment approach used by others (AECOM and Dynamic Risk 2009) combines information on the potential for oil spills of particular sizes with information on the proximity of that spill to sensitive areas. From a spill mitigation standpoint those sensitive areas include HCAs. HCAs are collectively identified by PHMSA and include input from multiple federal and state agencies, environmental groups, and the public; they are listed in a national database maintained by PHMSA and are updated periodically. For the pipeline route presented in the FEIS, the locations of HCAs were obtained from PHMSA by Keystone and were mapped in relation to the pipeline.[4] The definition of PHMSA-defined HCAs is discussed later in this report. The distances in miles from the proposed centerline of the pipeline to the HCAs were then calculated and compared to specific distance criteria provided in Table B-1 in Appendix B of the Risk Assessment to assess whether the HCAs could potentially be affected in the event an oil spill were to occur.

For each segment of the pipeline a combination of factors, including potential spill volumes, proximity to HCAs, and numbers of potential HCAs that may be impacted, were used as criteria for ranking the risks of a spill at each pipe segment. As part of the Risk Assessment and FEIS process, Keystone sought input from state agencies and natural resource trustees concerning locations referred to as operator-defined HCAs, which include other sensitive areas such as groundwater protection areas and USFWS-defined critical habitat for threatened and endangered (T&E) species. While no operator-defined HCAs were identified, Keystone conservatively classified all groundwater source water protection areas (SWPA) and wellhead protection areas (WHPAs) as HCAs for the Risk Assessment, regardless of whether they met regulatory criteria as PHMSA-defined HCAs. In Section 5of this report, we describe the methods we used as part of our own evaluation of whether there may be other particularly sensitive resources along the proposed route that are not specifically defined as HCAs, but where additional protection may be warranted.

The Risk Assessment states that a more detailed analysis of the risk to HCAs will be conducted by Keystone prior to commencing Project operations to support the development of an Emergency Response Plan (ERP) in compliance with the U.S. Department of Transportation's (USDOT) Integrity Management Rule (49 CFR Part 195). The final detailed analysis will reflect the final pipeline route selected after completion of the route alternative evaluations in the FEIS. Exponent was informed that the detailed analysis will evaluate worst case discharge volumes released at any location along the pipe, identifying potential spill flow paths, potential

[4] The locations of certain types of HCAs, including ecological and drinking water HCAs, are confidential due to Homeland Security issues.

for downstream transport under maximum stream flow velocities (over 20 miles), transport and fate of the released oil, and intersection with HCAs. We would suggest that a final detailed analysis incorporate lessons learned from the Enbridge spill in Marshall, Michigan, concerning fate, toxicity, and response actions. Keystone should also recognize that additional studies on the characterization of dilbit may be necessary. Keystone provided the preliminary HCA evaluation (Appendix B[5] of the Risk Assessment) to assist DOS in its preparation of the FEIS.

The following five sections summarize the *Structure* of the Risk Assessment (Section 2.1), *Purpose* of the Risk Assessment (Section 2.2), an overview of the *Risk Assessment Process* (Section 2.3), the approach for *Assessing Risks to Human Populations* and HCAs (Section 2.4), and the *Delineation of Pipeline Segments Potentially Affecting HCAs and the Risk Ranking Process* (Section 2.5). This section provides the reader with a summary of the methods used for the Risk Assessment. In addition, a brief description of the additional evaluations performed by Exponent and Battelle are provided to put the evaluations provided in Sections 3 through 6 of this report into context.

2.1 Structure

The Risk Assessment includes a brief Project overview and introduction, a section on incident frequency and spill volumes, a discussion on the consequences of a spill, a section on the pipeline safety program, conclusions, and two confidential appendices (Appendices A and B) addressing incident frequencies and spill volumes for environmental consequence estimation and risk ranking.

The sections on the pipeline safety program and mitigations measures in Appendix A of the Risk Assessment (Appendix P of the FEIS) discuss leak detection measures, quality control, a pipeline maintenance program, third-party issues, and threat mitigation measures (e.g., corrosion prevention and emergency response).

2.2 Purpose

The purpose of the Risk Assessment is to provide decision makers with sufficient information to understand the potential hazards associated with the transportation of crude oil through the Keystone XL Pipeline. Specifically, the Risk Assessment identified the predicted spill frequency, relative magnitude of potential risk along the pipeline (i.e., the pipe) using a relative risk modeling approach, pipeline segments most susceptible to spills, and environmental consequences of a spill from the pipe. Because the preliminary Risk Assessment was developed early in the design and NEPA permitting process, the Risk Assessment was not intended as a predictive modeling effort that evaluated site-specific risk associated with an oil spill from the pipeline nor was the Risk Assessment intended to be an exhaustive transport and fate analysis conducted for operational and emergency response purposes. Those detailed analyses are required by Special Condition 14 and PHMSA regulations (as part of the Integrity Management

[5] Appendices A and B of the Risk Assessment are confidential due to site-specific information related to HCAs. These appendices were available to reviewing agencies, but not to the general public.

Program) and will be conducted after the final route is selected as part of the final design of the Project. As stated in the Risk Assessment, its purpose is threefold:

1. To provide a conservative range of anticipated effects from the operation
2. To provide a preliminary evaluation of potential risk during the pipeline's design phase
3. To provide Keystone with an initial basis for the development of emergency response planning and Keystone's Integrity Management Program.

2.3 Risk Assessment Process

2.3.1 Exposure Pathways Identified

Keystone conducted a threat assessment, which identified five primary threats that could result in a release:

- Corrosion (external, internal, and stress corrosion cracking)
- Materials and construction (e.g., pipe steel flaws, defective welds)
- Accidental damage from third-party excavation
- Incorrect pipeline operations
- Facility damage from natural hazards (e.g., landslides, floods).

The Battelle report, that is a companion to our environmental review, evaluates pipe design characteristics and the potential for leaks.

2.3.2 Estimated Frequency of Spills

The Risk Assessment utilized the PHMSA incident database (2008) and stated that the spill frequency analysis produced a conservative incident frequency of 0.000135 incidents per mile per year, equivalent to no more than 2.2 spills in 10 years for the 1,672 miles of the Project, including the Keystone Cushing Extension. An initial spill frequency of 1.38 spills per year was calculated and Keystone incorporated several factors such as technological advances, strength of material, increased regulatory control, and depth of cover to reduce the spill estimate about six fold to 0.22 spills per year. The number of 2.2 spills in 10 years was used throughout the report to calculate risks and impacts.

These estimates are reviewed and discussed in Battelle's companion report and an evaluation of the adequacy is not discussed further in Exponent's report.

2.3.3 Spill Volume Estimates

PHMSA's incident database (2008) was the source of the spill volume data used for comparison to the spill volumes estimated in the Risk Assessment. The Risk Assessment reported that the PHMSA data set (2002 to present) indicated that the majority of actual pipeline spills are relatively small; with 50 percent of the spills consisting of 3.0 barrels or less. In 85 percent of the cases, the spill volume was 100 barrels or less. In over 95 percent of the incidents, spill volumes were less than 1,000 barrels. Oil spills of 10,000 barrels or larger occurred in only 0.5 percent of cases. In Table 3-2 of the Risk Assessment, the frequencies of oil spills of different volumes that are predicted to occur over a 10-year interval were presented. Maximum spill volumes were discussed in the Executive Summary of the Risk Assessment.

These estimates are reviewed and discussed in Battelle's companion report and an evaluation of the adequacy is not discussed further in Exponent's report.

2.3.4 Transport and Fate of Spilled Oil

Section 4.2.2 of the Risk Assessment discusses transport and fate issues and contains a generic description of physical, chemical, and biological parameters, and the processes of oil degradation in soil and aquatic systems. Much of the discussion concerned crude oil in general and was not developed for the specific crude oil blends planned to be utilized in the pipeline: diluted bitumen and synthetic crude oil. Additional studies on the specific crude oil blends are needed.

Exponent has carried out an independent assessment of transport, fate, and the aquatic toxicity of the transported crude. This assessment is provided later in this report.

2.3.5 Effects/Consequences

Consequences of oil spills were evaluated in the Risk Assessment and FEIS using information on estimated spill probabilities and spill volumes together with proximity to sensitive areas. Impacts of spills were evaluated with respect to soils, vegetation and soil ecosystems, wildlife, water resources (groundwater and surface water), aquatic organisms, and wetlands/reservoirs/ lakes. For soils, plants and soil ecosystems, and wildlife, a general description of impacts was presented. The chemical benzene, one of the more toxic yet volatile and hence ephemeral constituents in crude, was used to judge the implications of exposure, risks, and the required clean-up in the event of a spill. When a more detailed analysis is conducted, a comparative study between the aquatic toxicity observed in the Enbridge spill in Marshall, Michigan, and benzene would be beneficial.

Consequences of a spill to groundwater were considered with respect to the following location characteristics where migration to groundwater would be more probable:

- Relatively shallow water table is present (as opposed to locations where a deeper, confined aquifer system is present)

- Soils with high permeability are present throughout the unsaturated zone
- Proximity to specific groundwater resources designated as HCAs.

The Risk Assessment relied on transport, fate, and potential risks associated with benzene to judge relative risks to groundwater resources. *Exponent evaluates the methodology and considers vulnerable groundwater areas later in this report.*

The Risk Assessment evaluated impacts to downstream surface water sources by comparing projected surface water benzene concentrations with the national maximum contaminant level (MCL) for benzene (5 parts per billion [ppb]) to evaluate drinking water safety and with aquatic toxicity thresholds to evaluate environmental safety. Because the pipeline will cross hundreds of perennial, intermittent, and ephemeral streams, the Risk Assessment evaluated categories of streams, based on the magnitude of stream flow and stream width. For surface waters, the assessment utilized the following three conservative assumptions to estimate potential spill effects for planning purposes:

- The entire volume of a spill was released directly into a waterbody
- Complete, instantaneous mixing occurred
- The entire benzene content was solubilized into the water column.

Exponent performed an independent evaluation of the effects and consequences analysis in the Risk Assessment, and performed additional independent evaluations to put the results in the Risk Assessment into perspective.

2.3.6 Wetlands, Reservoirs, and Lakes

The Risk Assessment included a discussion of potential impacts to wetlands, reservoirs, and lakes, and stated that the predicted effects of a spill reaching standing water (e.g., reservoirs, lakes) would depend largely upon the volume of crude oil entering the waterbody and the volume of water within the waterbody. Estimates were made of the amount of water necessary to dilute spill volumes below aquatic toxicity and drinking water thresholds. The Risk Assessment acknowledged that while this approach does not account for transport and fate mechanisms, mixing zones, environmental factors, and emergency response capabilities, it provides an initial screening benchmark for identifying areas of potential concern.

Exponent performed an independent evaluation using the information in the FEIS on these types of sensitive ecological habitats (wetland, reservoirs, and lakes) to determine if they were located along the pipeline in close proximity (i.e., 10 miles) of small stream crossings.

2.4 Risk to Human Populations and HCAs

Pipeline safety regulations use the concept of HCAs to identify specific locales and areas where a release could have the most significant adverse consequences. HCAs are defined within the Integrity Management Rule (49 CFR Section 195.450) and include:

- Populated areas (e.g., city, town, village, or other designated residential areas)
- Commercially navigable waterways
- Designated zones around public drinking water intakes using PHMSA-defined drinking water unusually sensitive areas (USAs)
- Unusually sensitive ecological resource areas that could be damaged by a hazardous liquid pipeline release, including:
  - An area containing critically imperiled species or ecological community
  - Multi-species assemblage areas
  - A migratory waterbird concentration area
  - Areas containing imperiled special status species or imperiled ecological communities where the species is aquatic, aquatic dependent, or terrestrial with a limited range
  - An area containing special status species where the species or community occurrence is one of the most viable, highest quality, or best condition, as identified by an element occurrence ranking (EORANK) of A or B.

The Risk Assessment identified a total of 141.2 miles of pipeline associated with HCAs, with 84.3 miles associated with drinking water source HCAs, 63.9 miles associated with ecologically sensitive area HCAs, and 17.2 miles associated with populated area HCAs. Keystone consulted with USFWS on special status species and identified appropriate conservation measures as necessary.[6] The probability of a spill occurring in a pipeline segment associated with a particular type of HCA was predicted based on the number of miles of pipeline associated with each type of HCA and the base number of average spills predicted to occur (e.g., 1 spill in 53 years for all HCAs crossed by the pipeline).

The Risk Assessment states that the portions of the pipeline that could potentially affect HCAs will be subject to higher levels of inspection and repair criteria (per 49 CFR Part 195), and identifies additional valve locations beyond the original design and regulatory requirements, as a

[6] Exponent was informed that DOS prepared a biological assessment that evaluated the impacts of construction and operation impacts on T&E and candidate species for the entire pipeline. USFWS issued the biological opinion on September 23, 2011, that concurred with the biological assessment findings.

measure to reduce potential risk to HCAs. As a result of the preliminary HCA evaluation, some proposed valve locations were moved and additional valves were added to protect HCAs. In addition, a yearly survey of HCA locations is planned to update the Integrity Management Program.

Exponent used information on the locations of HCAs provided by Keystone to assess the number of HCAs within 10 miles of the proposed center line of the pipeline along specific segments of the pipeline.

2.5 Pipeline Segments Potentially Affecting HCAs and the Risk Ranking Process

The Risk Assessment discussed specific portions of the Project referred to as contributory pipeline segments (CPSs) where, if a spill were to occur, crude oil has the potential to reach HCAs (i.e., "could affect" segments). The authors then developed a process to rank, in risk levels from 1 to 4, the degree of the potential risk for specific pipeline segments by assessing the spill volume and physical transport pathway factors.

The Integrity Management Rule requires that the pipeline be evaluated to identify pipeline segments in which the released crude oil from a failure occurring anywhere between the two endpoints of the value segments could migrate to and affect a HCA. To identify the segments of the pipeline that could potentially affect HCAs, a three-step process was used:

- In the first step, HCAs were screened to determine which areas were within a reasonable proximity to the Project's proposed centerline of the pipeline and also had a viable physical pathway to transport a spill to the HCA.
- The second step of the process was to review those specific segments of the pipeline where, if a spill were to occur, crude oil could potentially reach areas of a HCA or HCA buffer area that contribute to the purpose of the HCA. CPSs were eliminated if the intersection of HCA buffer with the pipeline did not interfere with the purpose of the HCA (e.g., the drinking water HCA buffer area intersects with pipeline below the drinking water intake).
- The third step ranked the relative risk of each pipeline segment capable of affecting a HCA.

Most of the pipeline was removed from consideration in Step 1 and Step 2 of the process. The risk ranking step utilized five factors to categorize the identified CPSs into one of four levels, with level 1 being of the highest concern and level 4 being of lower concern for potential impacts to impact HCAs. The proximity and number of HCAs and maximum spill volume within the CPS were key factors in the ranking of a CPS. The evaluation conservatively assumed 900,000 bpd throughput to calculate maximum spill volume.

The ranking process identified 196.5 miles of the pipeline where the CPSs were ranked from 1 to 4. For risk category 1 (the highest concern), 63.7 miles of the pipeline consisting of nine CPSs, were identified. The higher risk ranking was associated with major river crossings.

The CPS locations are a particular focus for Exponent's review because they are identified in relation to HCAs and because Exponent was tasked with identifying environmental characteristics that may indicate where other sensitive areas are located along the proposed route that are not specifically defines as HCAs. To the extent that such areas are identified in our review, the pipeline segments near these locations may be considered CPSs for the purpose of considering the advisability of additional oil spill controls (e.g., valves) or countermeasure plans.

3 Review of Crude Oil Composition

3.1 Introduction

The purpose of this section is to assess Keystone's characterization of the chemical and physical properties of the oil blends to be transported in the pipeline, and to compile crude oil compositional data used in the subsequent sections of this report. Exponent compared the characteristics of diluted bitumen (dilbit) and synthetic crude oil (SCO) to typical crude oil using data from a number of sources. The following are Exponent's key findings/conclusions, followed by our recommendations. The remainder of this section provides the documentation to support these findings/conclusions and recommendations.

3.1.1 Key Findings/Conclusions

- The physical and chemical characteristics of dilbit are consistent with a heavy crude oil
- The physical and chemical characteristic of SCO are consistent with a medium gravity crude oil
- The benzene concentrations of both oils are within the range of typical crude oils
- The concentrations of PAHs are within the range of typical crude oils.
- While the total acid number of dilbit is within the range of acidic crude oils, the fraction of the acids consisting of naphthenic acids is unknown
- For the factors considered by Keystone in the Risk Assessment, we agree with their conclusion that dilbit and SCO are sufficiently similar to crude oil so that they should not result in an excess risk in case of a release.

3.1.2 Recommendations

- Although PAH concentrations in petroleum are low compared to some environmental sources, this class of compounds can be a long-term driver for remediation and risk management following an oil spill. While not required at this stage in the process, Keystone should consider obtaining addition information on the PAH chemistry of the oils to be transported.
- Given the perceived link between tar sands processing and aquatic toxicity due to naphthenic acids, Keystone should consider obtaining addition information on the naphthenic acid content of the oils to be transported.

- Knowledge on the chemistry of dilbit continues to increase. This new information should be incorporated into planning and operations as appropriate (e.g., to improve the spill response planning).

3.2 Chemical Characteristics and Physical Properties

The FEIS and Risk Assessment focused on the two oils, dilbit and SCO, that will be primarily shipped from Alberta. As noted in the FEIS, the precise composition of these will vary by production location and as the result of upgrading processes. Data on the nature and chemical composition of these oils are available from the online database crudemonitor.ca. This database contains the results of regularly conducted analyses of western Canadian crudes including six heavy sour Canadian crude oils, eight types of dilbit, and seven SCOs. Using this information, Keystone concluded that the oil to be shipped by the pipeline is consistent with crude oils commonly shipped by pipeline and processed in the United States.

To evaluate this conclusion, we compiled data on Alberta dilbit and SCO from a number of published sources and compared their chemistry to that of typical crude oils. As summarized in Table 1 and on Figure 1, diluted heavy bitumen (dilbit) is generally similar in its physical characteristics to the heavy sour crudes. Distillation curves reveal the mass of the oil present in specific boiling ranges and indicate the relative distribution of lighter and heavier compounds. Lighter crudes are typically more mobile under environmental conditions, but are also more susceptible to weathering (e.g., evaporation) and biodegradation. Crudes with more heavy ends are less mobile, and while also subject to various weathering processes, can be more persistent in the environment. Because of the processing used to generate SCO, its characteristics are generally similar to a light crude. For these bulk characteristics, our findings are consistent with Keystone's conclusions.

In the National Transportation Safety Board's Pipeline Accident Report (NTSB 2012) on the Enbridge release in Marshall, Michigan, material similar to what will be transported in the XL pipeline was described as:

> Cold Lake Blend and Western Canadian Select crude oil condensate mixtures are regulated by the U.S. Department of Transportation (DOT) as class 3 flammable hazardous materials. Heavy crude typically is a mixture of crude oil (from 50 to 70 percent) and hydrocarbon diluent (from 30 to 50 percent). The material contains 20 to 30 percent volatiles by volume. The mixture is used as raw material in the production of fuels and lubricants. It is a brown or black liquid with a hydrocarbon odor; it is lighter than water with a specific gravity of 0.65 to 0.75. It exhibits a flashpoint of -31° F. The vapor is heavier than air, with a lower explosive limit of 0.8 percent and an upper explosive limit of 8 percent vapor concentration in air.

While slightly more detailed, this is consistent with the description used in TransCanada's risk assessment. If more chemical or oil characteristic data become available from the Enbridge incident, it should be incorporated as appropriate in spill response planning documents.

Table 1. Summary of crude characteristics data from crudemonitor.ca.

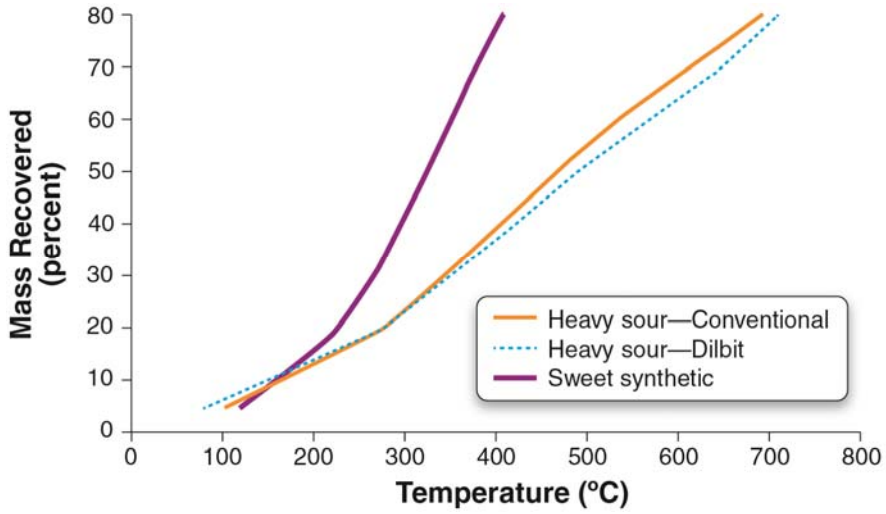

Figure 1. Simulated distillation curves based on 5-year average data from crudemonitor.ca.

Certain physical characteristics are important factors in predicting the transport and fate of petroleum in the environment. These are density, viscosity, and surface tension. Density information is available in the crudemonitor.ca database. Both the dilbit and SCO have densities below one, with the dilbit (929 kg/m^3) being heavier than the SCOs (857 kg/m^3). This means these oils are less dense than water when shipped, but the density can increase following a release due to the loss of the lighter hydrocarbon fractions. As with the transport of other heavy crudes, response plans should consider both floating and sinking oil. The viscosity of both dilbit and SCO can be changed by varying the relative mixture of heavier and lighter cuts. Keystone requires that material shipped in the Keystone XL Pipeline have a viscosity of 350 cST (Kothari 2010). The range of surface tension of crude oils is typically around 30 dynes/cm, and the interfacial oil/water tension varies with API gravity and is near 20 dynes/cm for heavy crudes (Lyons 1996).

Additional information on the chemical characteristics of dilbit may be available from entities involved in the response to the July 2010 Enbridge oil spill in Marshall, Michigan. Chemical fingerprinting of the source oil was conducted by the U.S. Coast Guard's (USCG) Marine Safety Laboratory. While one page summaries are available through the EPA Region 5 website, details were not provided. The full data reports including chromatograms can be requested from the USCG laboratory.

3.3 Potential Risk Drivers

To evaluate potential impacts of a release, it is important to have information on the concentrations of compounds that can drive risk to human health or ecological receptors. Benzene is a typical petroleum compound of concern and a focus of much of the evaluation of potential impacts to surface water and groundwater. The concentration of benzene in some dilbit is twice as high as the mean but well below the maximum benzene concentration of

69 crude oils (Rixey 2001; Table 2). The benzene concentration of SCO is less than the mean concentration for crude oil. These findings suggest that the risk due to benzene for either dilbit or SCO should not be greater than that due to a typical crude.

Table 2. Mean, standard deviation, and maximum benzene concentrations (mg/kg crude) from crudemonitor.ca compared to a screen of 69 crude oils (Rixey 2001)

	Mean	Standard Deviation	Maximum
Benzene (mg/kg)			
Sixty-nine crudes	1,340	-	5,900
Heavy sour conventional blend	857	280	1,501
Heavy sour dilbit blend	2,773	299	3,515
Sweet syncrude blend	374	163	1,122

Although PAH concentrations in petroleum are low compared to some environmental sources, this class of compounds can be a long-term driver for remediation and risk management following an oil spill. While not required at this stage in the process, Keystone should consider obtaining addition information on the PAH chemistry of the oils to be transported. The FEIS contains little discussion about the concentrations or potential environmental impacts of PAHs. While PAHs are considered to be among the most toxic of the nonvolatile compounds in petroleum, their concentrations are typically low (less than 1 percent to about 3 percent by weight) compared to their concentrations in materials such as coal tars. Oil contains both the unalkylated PAHs that are typically measured as part of environmental assessments and a number of alkyl-substituted forms. Recently published data on the PAH chemistry of dilbit and SCO (Yang et al. 2011) indicate the total concentration is in the low range (<0.5 percent) of crude oils. Table 3 compares the concentration of individual PAHs for a typical crude oil (Boehm 2006), dilbit, and SCO. The lower total PAH concentration is due primarily to depletion of the two- and three-ringed compounds such as the naphthalenes and fluorenes. Because of the ubiquitous nature of these compounds and the multiple sources other than oil, they are often present in sediments, unrelated to crude oil or petroleum. An understanding of the PAH profiles of pipeline oils would allow for differentiation between baseline and spill impacts.

Table 3. PAH concentrations (µg/kg) in a typical crude oil (Boehm 2006), dilbit, and SCO (Yang et al. 2011)

PAH	Crude Oil	Dilbit	SCO
Naphthalene	1,268	25	31

Given the perceived link between tar sands processing and aquatic toxicity due to naphthenic acids, Keystone should consider obtaining additional information on the potential range of naphthenic acid content of the oils to be transported in the future. Naphthenic acids are a class of compounds found in Canadian oil sands that can potentially result in aquatic toxicity if released into the environment and have been the subject of significant research (Clemente and Fedorak 2005). While questions about the link between these compounds and corrosion are discussed in the Section 3-13 of the FEIS, the FEIS does not discuss the potential environmental implications of this class of compounds. Exponent was informed that the majority of naphthenic acids are removed from Alberta crude upon extraction but that data are lacking on concentrations. The total acid number (TAN) is used as a surrogate. Although the toxicity associated with raw tar sand and tar sand process waters has been well studied, less is known about the acids found in dilbit. Because of the caustic soda washing process used to separate bitumen from oil sands, the acids remaining in dilbit should be depleted more than in water soluble compounds. TAN is an indicator, but not a direct measurement of, naphthenic acids found in crude. TAN values for heavy WCSB and dilbit are consistent with data from 18 international crudes (Aske et al. 2001; Table 4). With a TAN of > 1.0, dilbit would be considered to be an acidic crude, while the heavy WCSB crude is moderately acidic (APEC 2005). Naphthenic acids are not present in SCO.

Table 4. Total acid number (mg KOH/g) compared to a screen of 18 crude oils (Aske et al. 2001)

Mean of 18 Crudes	Median of 18 Crudes	Heavy Sour–Conventional	Heavy Sour–Dilbit	Sweet Synthetic
1.20	0.60	0.64	1.46	0.00

4 Transport and Fate of Spilled Oil

4.1 Introduction

This section presents Exponent's independent assessment of the potential transport and fate of oil in the event of a spill from the Keystone XL pipeline as discussed in the Risk Assessment (Appendix P of the FEIS). Exponent conducted additional transport and fate analyses and a review of the empirical literature related to crude oil spills to provide additional detail on the behavior of potential spills beyond that provided in the Risk Assessment. This information was needed to address questions that DOS and other agencies have posed to Exponent concerning identification of sensitive environmental resources and potential impacts not addressed in the Risk Assessment.

The FEIS provides extensive discussion of groundwater and surface water resources along the path of the pipeline. An evaluation of the potential magnitude of spills and the consequences of a spill to these resources is presented in the Risk Assessment. The PHMSA spill information and the methods used by Keystone to predict the magnitude of potential crude oil spills from the Keystone XL Project presented in the Risk Assessment are reviewed in detail as part of Battelle's third-party review, and are not discussed in Exponent's evaluation.

The Keystone transport and fate evaluation in the Risk Assessment related to spilled oil is primarily a qualitative description of the physical and chemical processes that act upon oil in the environment and influence the distance that the oil may travel. The extent of transport of a particular spill depends on the leak rate and duration, properties of the oil released (presented in Section 3), as well as specific site conditions. The Risk Assessment provides limited quantitative evaluation to estimate the potential extent of a spill. Our review of transport and fate takes into account the characteristics of the oil as described in Section 3 of the Risk Assessment. Our assessment relies on information provided in the Risk Assessment and FEIS, on empirical and literature data (e.g., viscosity of the oil and distance that oil spills have been known to travel in surface water), and on screening calculations made to quantitatively check statements in the Risk Assessment and to help support other aspects of our evaluation.

Our evaluation of sensitive groundwater and surface waters depends in part on how the spilled oil will behave in these environments. Therefore, we were interested in considering how quickly large and small spills might reach aquifers and the behavior of dissolved constituents in these aquifers. Our screening calculations are not an exhaustive transport and fate analysis. The detailed analyses that are required by Special Condition 14 and PHMSA regulations, as part of the Integrity Management Program, will be conducted after the final route is selected as part of the final design of the project. As noted, our evaluation in this regard is essentially a check on the work that has been conducted for the Risk Assessment, but also supports our examination of locations of shallow groundwater receptors that may be impacted by a spill. The rate of migration of an oil spill to and in groundwater is an important consideration because the relative speed of these processes is an important consideration for ERP development and bears directly on response time planning and the ability to contain and clean up spills that might occur.

Similarly, the distance that a spill to surface waters could travel is important for identification of HCAs and for spill response planning.

The following sections provide quantitative estimates of the potential transport of oil to groundwater for two scenarios: a large volume spill or rupture, and a small leak. A discussion of the potential transport of oil overland is also provided. The analyses are based on a general range of conservative conditions and are intended to provide a sense of scale of potential oil impact. Thus, findings are expected to be a conservative characterization of what could happen along the pipeline. For each of the quantitative evaluations described above, we considered the ramifications of the findings of our evaluation in light of the effects they would have on the final Project design and ERP. The following are Exponent's key findings/conclusions, followed by our recommendations. The remainder of this section provides the documentation to support these findings/conclusions and recommendations.

4.1.1 Key Findings/Conclusions

- The flow of oil overland is affected by many variables including spill rate, topography, soil type, and vegetation. To provide a sense of scale, a highly simplified case of a sudden spill of 25,000 bbl to a flat surface is presented. If the spill flows in a radial pattern, is 1 ft deep, and there is no spill response, it would spread with a radius of about 200 ft. A pool with a depth of 0.1 ft would spread to a radius of about 700 ft. If a surface spill was influenced by topography and flowed in a channelized manner, the distance traveled could be on the order of thousands of feet, depending on the steepness of the terrain, presence of vegetation, etc. Keystone conservatively assumed in the Risk Assessment that a large spill would be capable of moving overland up to 1 mile. Therefore, considering our analyses, the 1 mile distance criterion used in the Risk Assessment is considered adequate. Where HCAs are located within 1 mile of the pipeline, Keystone is required to perform a site-specific evaluation of overland flow (spreading analysis).

- Exponent applied a numerical screening model, the hydrocarbon spill screening model or HSSM, to estimate the behavior of a large spill of dilbit from the pipeline in an area with a high permeability shallow aquifer. The HSSM modeling simulation showed that groundwater impacts from a large spill would likely occur first from infiltration from the trench near the rupture and not from oil spread across the ground surface. Oil in the potentially filled trench near the rupture could begin forming a non-aqueous phase liquid (NAPL) lens at the water table in less than 1 day if the water table is 1 ft below the trench (8 ft below ground surface), in 7 days if the water table is 3 ft below the trench (10 ft below ground surface), and in 50 days if the water table is 10 ft below the trench (17 ft below ground surface). In contrast, oil infiltrating from the ground surface would reach a water table 8 ft below ground surface after approximately 240 days.

- Results from HSSM simulations of a large spill (25,000 bbl) illustrate that plume lengths for dissolved hydrocarbons (i.e., benzene at or above the

MCL) under typical groundwater gradients could be between 100 and 900 ft in length. This range is consistent with those reported in the literature; most reported plumes are less than 200-300 ft and a very small number of plumes exceed 1,000 ft. HSSM simulations were also performed to explore an elevated groundwater gradient, representing the potential influence of groundwater extraction (irrigation wells) near the pipeline. When coupled with a simulated low degradation rate (representing an upper bound condition), the higher groundwater gradient could extend the plume length to as much as 2,600 ft.

- Modeling results agree with the conclusions in the Risk Assessment that a small leak going undetected indefinitely is unlikely. More likely, oil from a small "pin hole" leak (28 bbl/day) would reach the ground surface on a time scale of a few months. Based on the screening level modeling, a benzene plume that may form because of a small leak was estimated to travel downgradient by as much as 600 ft.

- Many private wells located near the pipeline do not meet the criteria to be classified as HCAs in the Risk Assessment. Exponent considered potential factors that could be used to identify non-HCA groundwater areas for shallow groundwater (< 50 ft) where more extensive spill prevention measures and monitoring may be warranted. Based on our analysis of possible plume dimensions, we selected a downgradient distance of 1,000 ft from the proposed centerline of the pipeline as a reasonable boundary of a plume for identifying shallow groundwater and associated wells that could be within the influence of an oil spill. This distance recognizes that large spills would be readily detected and remediated and that small leaks that could take longer to be detected would have smaller plumes. Based on an independent review of the NEDNR well database in Nebraska, Exponent identified approximately 260 wells (not screened by depth) within 1,000 ft of the proposed centerline of the pipeline. Most of these wells are used for irrigation purposes but domestic wells are also present, several of which draw from shallow groundwater. This list will need to be revised once the final pipeline is determined.

- The relative vulnerability/sensitivity of groundwater resources to a dissolved hydrocarbon plume from an oil spill can be assessed by considering combinations of several factors: 1) proximity to the pipeline (<1,000 ft); 2) depth from point of the oil release to the water table (e.g., release of oil at or below the water table will affect groundwater quality more quickly than releases many feet above the water table); 3) depths of receptor wells (wells that are 10s of feet deep are more vulnerable than wells that are 100s of feet deep); and 4) the pumping of receptor wells (wells with higher pumping rates are more likely to draw plumes further downgradient than wells with lower pumping rates). The following combination of factors could be used to identify groundwater resources that do not meet the listing criteria for HCAs but may be more vulnerable to a dissolved benzene plume emanating from an

oil spill. An example of this would be a cluster of irrigation wells and domestic wells located within 1,000 ft of a pipeline segment where a release of oil occurred in or within a few feet of the water table.

- The assessment in the FEIS conservatively assumes that in the event of a worst-case spill in which all of the benzene partitions from the oil into water in streams with a range of flow rates. The assessment is useful for comparison of worst-case benzene concentrations to human health and ecological concentration benchmarks and is discussed further in Section 5 of our review. However, the FEIS does not provide an evaluation of possible transport distances of oil via surface water. This appears to be a gap that needs to be addressed.

- The primarily qualitative assessment of the transport and fate of oil in the event of a spill presented in the Risk Assessment is consistent with our analysis and review of the literature. Ultimately, quantitative analysis of transport and fate in surface waters is required by Special Condition 14 and PHMSA regulations as part of the Integrity Management Program during the final design of the project after the final route is selected. These evaluations should take into account the lessons learned from the pipeline rupture in Enbridge, Michigan in 2010.

4.1.2 Recommendations

- Keystone, as part of the final Project design, should perform further evaluation of overland flow (spreading analysis) of spilled oil, and further evaluation of the transport of spilled oil in small streams (e.g., the downstream distance crude oil could travel from the proposed centerline of the pipeline) for purposes of ERP. These analyses should take into account potential density and viscosity increases associated with the loss of volatiles from heavy crudes and diluted bitumen.

- Keystone should use the screening criteria (e.g., well depth, depth of release compared to water table, lithology between pipeline and aquifer) suggested in our report for identifying vulnerable/sensitive groundwater resources adjacent to the pipeline that do not classify as HCAs but that may be more vulnerable to exposure to a benzene plume in the event of a an oil spill. For example, these could be defined as clusters of both domestic and irrigation wells within 1,000 ft of a pipeline segment where an oil spill could occur in or within a few feet of the water table. Exponent recommends that additional modeling be performed as part of the final design of the Project to further refine the appropriate downgradient distance criteria to be used for identifying sensitive clusters of wells. Exponent recommends that these non-HCA groundwater resources should be afforded a degree of protection from the occurrence of an oil spill and from the consequences of a spill similar to what is currently afforded to groundwater resources that are defined HCAs.

- Considering the above-mentioned screening analysis, Exponent recommends that Keystone consider how to improve upon external leak detection through more frequent inspections and education of property owners for wells within these areas of sensitive groundwater resources.

4.2 Transport and Fate on Land (Overland Flow)

An assessment of overland flow provides insight into the vulnerability of sensitive areas with respect to distance from the pipeline. Overland flow of a large spill will depend on many factors, including topography, ground cover, soil type, product characteristics (e.g., dilbit versus more traditional crudes), meteorological conditions, and other factors that affect infiltration, evaporation, and flow of spilled product, as discussed in FEIS Section 3.13.5.1. However, the FEIS does not appear to include a quantitative evaluation of how far spilled oil might move over land.

Keystone updated the analysis of spill frequencies and volumes (TransCanada 2011) that had been presented in the Risk Assessment. The updated analysis evaluates the worst-case volume of a spill at specific points along the pipeline based on topography, valve location, and other factors. This analysis reflects a major pipe leak or rupture, which results in complete draining of oil from a section of the pipeline. The calculation was performed at varying intervals based on where the most accurate elevation data were available. Fifty percent of all spills modeled by Keystone were less than 6,375 bbl and the maximum was approximately 25,000 bbl (TransCanada 2011, p. A-12, Figure A-2).

For the purposes of conducting a simple screening calculation to evaluate how far oil might travel, upper bound values (i.e., maximum values for travel distance) can be calculated using simplifying assumptions. For example, using a spill size of 25,000 bbl, if uniform radial flow from a spill source is assumed on a flat landscape, the product could spread hundreds of feet, depending on the pool depth assumption. Only accounting for the geometry of the pool, a 25,000 bbl pool of 1 ft depth would spread with a radius of about 200 ft; a pool with a depth of 0.1 ft would spread to a radius of about 700 ft.

If a surface spill occurs in a situation where topography causes the product to flow in a channelized manner, the distance traveled could be on the order of thousands of feet, depending on the steepness of the terrain, presence of vegetation, etc. This projected distance is less than that used for the Risk Assessment, which conservatively assumed a large spill would be capable of moving overland for 1 mile. Using this distance, Keystone evaluated whether a spill that travels 1 mile would intersect with the buffer zone surrounding HCAs. HCAs included sensitive drinking water resources that were identified during the EIS process. Any pipeline segment that could contact an HCA buffer was considered a "could affect" segment. Future detailed analysis of overland flow that accounts for such factors as topography, transport channels, and the presence of water is required by Special Condition 14 and PHMSA regulations as part of the Integrity Management Program during the final design of the Project. So, the initial 1-mile criteria will be expanded as appropriate during the final design phase of the Project.

4.3 Transport and Fate in Groundwater

In support of Exponent's review of the Risk Assessment, and to address specific issues from DOS, the following sections discuss transport and fate processes in groundwater; evaluate large spill and small spill scenarios and their potential impacts on groundwater; and provide an evaluation of sensitive groundwater areas near the pipeline.

4.3.1 Transport and Fate Processes in Groundwater

The FEIS (Section 3.13) points to the Bemidji, Minnesota, crude oil spill site as a basis for predicting the potential impacts to groundwater of an oil release. Exponent agrees with this approach because of the consistency in dissolved hydrocarbon behavior at Bemidji and other petroleum impacted sites (Newell and Conner 1998; U.S. EPA 2002; Essaid et al. 2011). These studies indicate microorganisms that can consume hydrocarbons are ubiquitous in shallow groundwater. Biodegradation of dissolved petroleum constituents result in a reduction of mass and limits plume lengths. This process, called natural attenuation, is recognized as a valid remedial technology by EPA and other regulatory agencies (ITRC 1998; U.S. EPA 2002, 2004).

Exponent agrees with the FEIS finding that even if oil reaches groundwater, dissolved hydrocarbon plume lengths are unlikely to be more than a few hundred feet. The FEIS cites an American Petroleum Institute report (Newell and Conner 1998) that presented the results of four studies (a total of 600 plumes evaluated) that found the median dissolved hydrocarbon plume length ranged from about 100 to 200 ft. Seventy percent of the 600 plumes considered in the studies were less than 200 ft and 90 percent were less than 320 ft. Our review of more recent studies (Ruiz-Aguilar et al 2003; Shih et al. 2004; Kamath et al., 2012) confirms the finding that most benzene plumes are less than 200 ft and very few plumes exceed 1,000 ft. Dissolved BTEX plumes were observed at the Bemidji site approximately 20 years after the spill and extended from 300 ft to 600 ft downgradient (in the direction of groundwater flow) (Essaid et al. 2011), which further supports the length scales for potential dissolved groundwater plumes discussed in the FEIS.

Most of the hydrocarbon plumes studied were in shallow groundwater and at sites not under the influence of large volume groundwater extraction (irrigation) systems. Large volume groundwater production wells have the potential to locally increase hydraulic gradients resulting in more rapid transport of groundwater contaminants. Site-specific modeling is required to determine whether such systems may influence local plume lengths.

In the following sections, we apply screening models to evaluate the potential range of downgradient migration distances for dissolved hydrocarbons. These analyses are intended as a crosscheck against the empirical data found in the literature, based on potential spill and migration scenarios in the pipeline context.

4.3.2 Large Spill

We used a screening model to examine the behavior of a large spill from the pipeline. The purpose of the analysis was to gain insight into the rate of transport and spreading and the

distances and areas that may be impacted. This information is used elsewhere in this report to assist in evaluating the vulnerability of potentially sensitive groundwater areas. A key consideration in this regard is the ability to respond to and control a spill before it spreads to sensitive areas or before it results in a dissolved hydrocarbon plume that may affect such areas. Our assessment has been incorporated into recommendations concerning mitigation that are provided in the Fate and Transport from an Engineering Perspective section of the Battelle report.

4.3.2.1 Infiltration and Potential Groundwater Contamination

The potential scale of infiltration of oil and dissolved constituents and subsequent contamination of groundwater from a large, rapid release, such as the pipeline spill in Bemidji, Minnesota, in 1979 was evaluated using the Hydrocarbon Spill Screening Model (HSSM) developed for EPA (Weaver et al. 1994). HSSM is a screening model that includes a variety of chemical and hydrologic processes and is based on a simple conceptualization of a LNAPL release. The model simulates vertical LNAPL flow and transport from the ground surface to the water table due to gravity and capillary forces. The LNAPL is then simulated to float and spread radially in the capillary fringe forming a LNAPL lens. Additionally, HSSM simulates dissolution of chemical constituents of the LNAPL into the aquifer and migration in the direction of groundwater flow creating contaminant plumes. Simulations with HSSM are an illustrative and simplified screening-level calculation and should not be relied upon for final risk determinations, emergency, and/or environmental planning/response actions.

HSSM was used to estimate the potential for groundwater contamination from oil spilled on highly permeable soil (i.e., sand) and the downgradient groundwater transport of dissolved contaminants (i.e., benzene) from the spill in an area with a highly permeable, shallow aquifer. These conditions represent a potential worst-case scenario that may occur along the pipeline. The objective for these simulations is to evaluate if the Risk Assessment made realistic statements about the potential impacts of a large spill to shallow groundwater.

A simple conceptual model of a large spill is used for HSSM simulations. A large release is defined as 25,000 bbl (1,050,000 gallons) which is consistent with the large spill volume considered for the over-land flow calculations (see Section 4.2). The spilled oil is assumed to be released rapidly and quickly move from the pipe up to the ground surface and spread over an area of 4.5 acres[7] (in circular area with a radius of 250 ft)[8]. Surface spreading of the oil reduces the rate of oil infiltration as the thickness of the oil on the surface (and therefore the pressure driving flow) decreases. High-pressure oil is assumed to move to the ground surface because of the low vertical pressure applied by the overlying trench backfill relative to the anticipated pipeline operating pressure (the FEIS specified the maximum pipeline operating pressure to be

[7] 4.5 acres was the approximate aerial extent of the Bemidji, MN spill and was assumed as the surface area for large spill modeling. This assumption is conservative in that the modeled large release is more than double the volume of the Bemidji, MN spill (25,000 bbl versus 10,700 bbl) (Essaid et al. (2011)) but is being applied over the same area.

[8] This was an assumed area for calculations using HSSM. The spill footprint would likely vary depending on local topographic conditions. Smaller footprints would tend to lead to higher infiltration as oil would pond deeper and have more head to induce flow. Larger areas would have an opposite effect.

1,600 psig). Oil released at high pressure is anticipated to move in the direction of the lowest principle stress (i.e., upward) and away from lateral and underlying soil confinement. Based on an assumed area of 4.5 acres, and a volume of 25,000 bbl, oil is simulated to initially pond at a depth of 0.75 ft (i.e., all oil is assumed to move to the ground surface). The spill is assumed to occur instantaneously over the 4.5-acre area, and exist at a constant depth of 0.75 ft for one hour[9] followed by a gradual decrease to zero surface depth as the ponded oil infiltrates. This model simulates the vertical infiltration of oil spread on a uniform ground surface.

In addition to oil infiltrating from the ground surface, if a large rapid release occurred from the buried pipeline, localized filling of the trench with oil might result. This zone of filled trench will have a greater depth of oil to drive infiltration than oil spread on the ground surface, and will originate from an elevation closer to the water table than the ground surface. Based on this conceptual model of infiltration from a large spill, a second scenario was developed for HSSM simulations in which oil was simulated to infiltrate from the bottom of the filled trench. The trench was assumed to be 7-ft deep[10], and was modeled to be filled with 7 ft of oil[11] atop the trench bottom for one hour (during the release) followed by a gradual decrease to zero ponded depth as the oil infiltrated. Although the maximum operating pressure in the pipeline is specified in the FEIS to be 1,600 psig, oil released at high pressure is assumed to rapidly lose pressure as oil spreads outward into the trench backfill and to the ground surface. Thus, our trench simulation assumes that only gravity and capillary forces drove flow.

For both scenarios, i.e., infiltration from ground surface over a large area and infiltration from the filled trench, the water table was assumed to be at least 0.3 ft below the base of the trench[12] to evaluate behavior where groundwater is shallow but spills do not occur directly in groundwater.

Hydrologic parameters were defined for permeable sand, a worst case soil condition in terms of maximized transport, based on data in U.S. EPA (1985a,b), and Carsel and Parrish (1988). Soil porosity and vertical hydraulic conductivity (to water)[13] were assumed to be 0.35 and 23ft/day, respectively. Horizontal hydraulic conductivity was assumed to be 10 times the vertical hydraulic conductivity or 230 ft/day. Of note, less permeable soil conditions, i.e., less conservative soil conditions, are present for the majority of the proposed pipeline route (FEIS, Section 3.2). These materials are likely to be orders-of-magnitude less permeable and would likely result in longer times for infiltrating oil to reach groundwater and shorter plume lengths than those described in our simplified and conservative simulations.

---

[9] One-hour release duration was used to be consistent with Section 4.2.3.4 of the RA.

[10] PHMSA Special Condition 19 requires the pipeline soil cover be at minimum forty-eight inches plus the thirty-six inch pipeline diameter.

[11] The soil in the trench immediately adjacent to the rupture was neglected due to the unknown effects of a large and rapid release on the porosity of this soil.

[12] Since HSSM cannot simulate a spill below the water table, the spill is assumed at least 0.3 ft below the trench; 0.3 ft is the minimum soil thickness that can be accurately simulated by HSSM.

[13] Hydraulic conductivity is a fluid specific parameter. HSSM corrects the water hydraulic conductivity for oil hydraulic conductivity.

The viscosity of the oil was assumed to be 350 cSt (325 cP at a specific gravity of 0.93) consistent with viscosity reported for diluted bitumen (Kothari 2010). The viscosity assumed for diluted bitumen is considered to be a conservative assumption, once volatile components of the oil evaporate, because viscosity has been shown to rapidly increase, which will slow transport (Belore 2010). Increases in the viscosity of diluted bitumen after release from the pipeline will be greater than for synthetic crude (Kothari 2010), but to be conservative, this is not taken into account in this analysis[14].

Modeling attenuation requires inclusion of a first order decay rate (λ). Based on a review of published results, EPA suggests a rate λ between 0.001 and 0.01 per day (U.S. EPA 2002) for benzene and other petroleum hydrocarbons. All other model parameters were within typical value ranges proposed by Weaver et al. (1994) for use in HSSM.

Figure 2 shows the time for LNAPL to reach the water table and begin forming a groundwater plume as a function of the depth from the ground surface to the water table. Figure 2 does not show depths to water table less than seven feet, i.e. the pipeline at or below the water table, because groundwater plume formation would be immediate. LNAPL simulated to infiltrate from the bottom of the initially filled trench reaches groundwater and begins forming a plume far before LNAPL infiltrating from the surface due to both the reduced depth to the water table and the greater pressure of the deeper ponded oil filling the trench (initially 7 ft versus 0.75 ft). For the assumed conditions, these results illustrate that oil from the filled trench could reach a water table 1 ft below the trench (8 ft below ground surface) within 1 day of release, or a water table 3 ft below the trench (10 ft below ground surface) within 7 days of release. However, a water table 10 ft below the trench (17 ft below ground surface) would take approximately 50 days. In contrast, oil infiltrating from the ground surface would reach a water table 8 ft below ground surface only after approximately 240 days. Because a large spill would likely be detected and appropriate responses taken, infiltration from the simulated trench is likely to govern potential plume generation.

The period between the spill event and the development of a groundwater plume is an important consideration for judging the efficacy of spill control. For the situation described here for infiltration from the filled trench, rapid clean-up would be required to minimize groundwater impacts.

[14] Note that the pipeline may carry synthetic crude, which would have a lower viscosity. The significance of this is discussed further below.

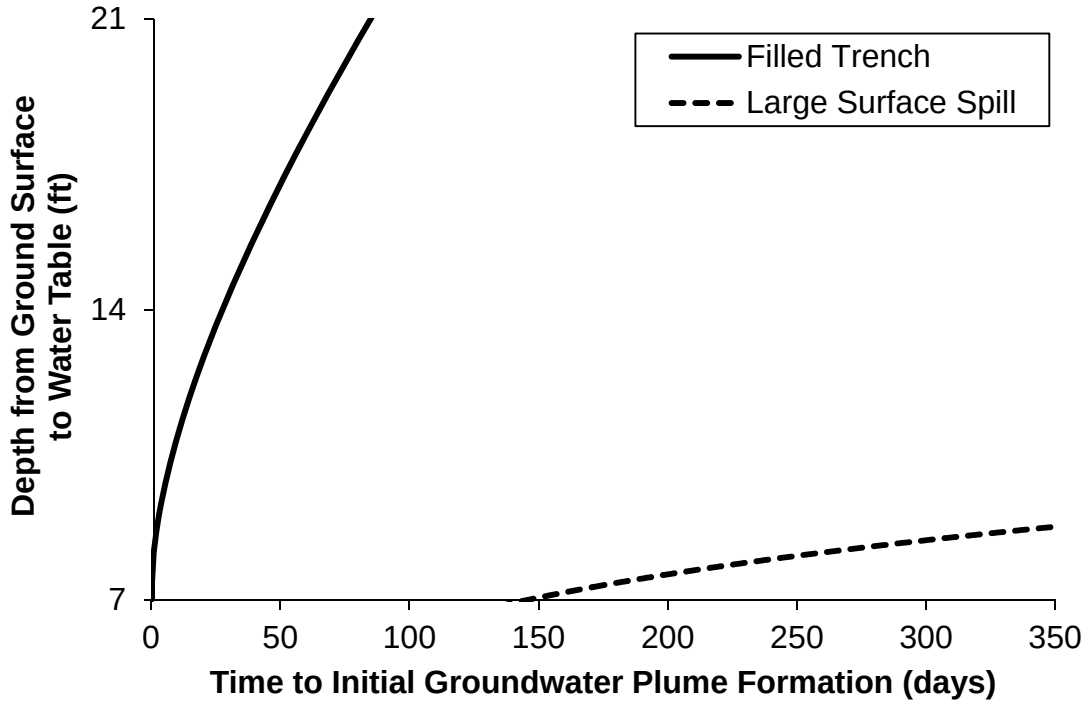

Figure 2. Time for spilled oil to reach the water table and initiate formation of a groundwater plume versus the depth from the ground surface to the water table.

HSSM was used to simulate dissolved benzene transport from the NAPL plume[15] associated with infiltration from the filled trench simulation described previously. Plume simulations were conducted for water table depths of 0.3, 1, and 10 ft below the trench bottom (i.e., 7.3, 8, and 17 ft below the ground surface). These depths were chosen to provide a sense of scale associated with different potential water table depths. For these simulations, the groundwater hydraulic gradient was assumed to range from 0.001 to 0.01. This range represents a reasonably low natural gradient (0.001)[16] to an increased gradient (0.01). Gradients occurring due to groundwater extraction depend on the local aquifer characteristics, the distance from the extraction well, and pumping rates. Since HSSM does not directly simulate pumping wells, a gradient of 0.01 was used to approximate an elevated gradient possibly associated with groundwater extraction. However, hydraulic gradients induced by pumping wells could be higher under certain local conditions. A range of half-lives ($t_{1/2}$) from 639 to 63.9 days[17] was used to account for the degradation of benzene. The hydraulic gradient and benzene concentrations were varied due to the high variability associated with these parameters.

---

[15] Partitioning and transport parameters for benzene were determined from Weaver et al. (1994) and McMillen et al. (2001). Partitioning coefficients for benzene for crude oil were assumed.

[16] Based on the FEIS (Section 3.3; p. 3.3-9); a groundwater velocity of 1 ft/day is reported with a hydraulic conductivity of 60 ft/day for the High Plains Aquifer. Considering that natural porosities generally range between 0.3 and 0.4, the corresponding groundwater gradient is between 0.005 and 0.007, which is within the range simulated. Gradients are probably locally variable, thus assumed values provide a reasonable range for evaluation.

[17] Half-lives for benzene were calculated based on first order decay rates of $\lambda = 0.001$/day to $\lambda = 0.01$/day using the equation $t_{1/2} = Ln(2)/\lambda$.

The HSSM simulation conservatively assumes that no action is taken to remove the oil from the trench after the spill, although such actions are anticipated in the FEIS (Section 4). Oil recovery would reduce the impacts of infiltrating oil. A large, rapid spill would likely be more of a concern to surface water and sensitive areas, which could be impacted more quickly by overland flow or direct release to a water body and this is discussed subsequently. The HSSM simulations indicate that dissolved plumes (defined as groundwater benzene concentrations exceeding the MCL of 5 ppb) may develop from a large spill. LNAPL was assumed to vertically infiltrate over a 6-ft diameter circle, equal to half the average width of typical trench described in Section 2.3.2.3 of the FEIS. Table 5 summarizes the simulated plume lengths resulting from each water table depth, hydraulic gradient, and benzene half-life considered.

Table 5. Benzene plume lengths estimated by HSSM for a large (25,000 bbl) rapid release of diluted bitumen for different depths from trench bottom to water table, hydraulic gradients, and half-lives ($t_{1/2}$).

Depth from Trench to Water Table	Hydraulic Gradient	Plume Length	
		$t_{1/2}$ = 69.3 days	$t_{1/2}$ = 693 days
0.3 ft[a]	0.001	100 ft	200 ft
0.3 ft[a]	0.01	300 ft	500 ft
1.0 ft	0.001	200 ft	400 ft
1.0 ft	0.01	700 ft	2,300 ft
10 ft	0.001	300 ft	900 ft
10 ft	0.01	700 ft	2,600 ft

[a] Minimum depth that can be modeled accurately with HSSM.

The HSSM simulation results indicate that plume lengths resulting from a large release may be between 100 and 2,600 ft in length. For the more conservative longer half-life simulations, plume lengths were increasingly sensitive to the applied hydraulic gradient.

For the large-spill scenarios considered, the plume lengths estimated using HSSM are generally consistent with the literature compilations of field studies described previously in this section and in the FEIS[18]. Our review of literature on observed dissolved plumes related to hydrocarbon releases (see Section 4.3.1) indicates that a very small number of plumes exceed 1,000 ft with most plumes less than 200–300 ft. Thus, the plume lengths associated with groundwater gradients typical of the natural conditions (e.g., 0.001) reported in Table 5 are consistent with what has been observed in the field. Plume lengths of up to 2,600 ft in Table 5 are associated with the higher groundwater gradient of 0.01 which is intended to represent the potential influence of groundwater extraction near the pipeline (conditions not necessarily accounted for in the case studies discussed in Section 4.3.1). Although pumping wells increase hydraulic gradients, this increase is typically limited to a finite zone surrounding the well, the extent of which is dependent on pumping rate and aquifer characteristics. Analyses that include these site-specific conditions are required by Special Condition 14 and PHMSA regulations as

[18] Assumes no action is taken for 1–2 years which allows NAPL to reach water table and for a plume to develop.

part of the Integrity Management Program during the final design of the project. These analyses should include the potential for longer plume lengths, i.e., > 1,000 ft, in fractured or karst terrains discussed in Section 3.1 (Geology) of the FEIS.

The HSSM simulations do not account for a release below the water table. This type of release could occur in locations where the pipe may be seasonally or permanently submerged below the water table. In the event of a leak below the water table, because of buoyancy the oil would tend to float to the water table surface and form a NAPL lens. This type of release would also result in immediate contact between the NAPL and groundwater resulting in immediate development of a dissolved NAPL plume. Because other factors controlling the size of the plume (e.g., degradation and groundwater gradient) would be similar, plume sizes would be expected to be similar.

4.3.3 Small Leak

Large leaks, as evaluated above, are easier to detect because they will likely trigger alarms from components of the leak detection system described in the Risk Assessment. However, very small leaks could potentially go undetected for longer periods of time. The Risk Assessment provides a description of four pipeline leak detection methods that are based on measured flow rates, pressures, and other measured and calculated values. Each of the four methods has different minimum leak sizes (flows) that can be detected, down to 1.5–2.0 percent of the pipeline flow rate[19]. One method is capable of identifying low rate releases below the 1.5–2.0 percent; however, how much below 1.5–2 percent is not stated in the Risk Assessment.

Because small leaks may go undetected for longer periods of time, there is a potential for transport of oil spilled from the pipeline (i.e., diluted bitumen or synthetic crude oil) and the development of a dissolved constituent (i.e., benzene) plume that could ultimately result in impacts to groundwater resources downgradient from the pipeline. The potential extent of downgradient impacts in not quantitatively evaluated in the FEIS and discussed here.

Under shallow groundwater conditions, leaking oil will infiltrate downward through the vadose zone (soil not saturated with water between the ground surface and the water table) until the water table is intersected. Once the oil reaches the water table, vertical migration of the oil slows and oil begins to accumulate in the vadose zone above the water table. For a buried pipe in relatively flat terrain, this could result in filling of the pipe trench and ultimately surface expression of the oil. Lateral (sideways) migration of the oil along the length of the pipeline could occur within the trench, which could extend the time until surface expression of the leaking oil occurs. For buried pipe in sloping terrain, lateral migration of oil could be greater, but also may result in surface expression sooner, when a barrier to oil flow (e.g., trench blocker) is encountered.

[19] 1.5–2% of daily flow rate = 13,500–18,000 bbl (assuming a pipeline flow of 900,000 bbl/day).

As part of the screening analysis, HSSM was used to estimate the following:

- Rates of slow oil leaks that may go undetected below the surface for extended periods of time for a flat terrain condition (assuming detection is only possible through direct inspection or survey of the pipeline because the leak rate is below the limit of other leak detection methods)
- Possible volume of a crude oil spill resulting from a slow and undetected leak
- Possible downgradient extent of dissolved contaminant plume in groundwater (defined as groundwater benzene concentrations exceeding the MCL of 5 ppb).

As in the case of the large spill simulations discussed previously, the small leak calculations are intended to provide insights into the potential transport and fate of oil spilled from the pipeline. This information is used to provide insights into which sensitive groundwater resources may be vulnerable if a spill of oil would occur, which in turn will help provide a check of the distances used in the Risk Assessment to evaluate whether a groundwater resource should be considered vulnerable during preliminary project design. For the slow-leak HSSM simulations, the leak rate is assumed to be below the detection limits for any of the pipeline remote leak detection systems. Thus, leak detection is assumed to be limited to visual or aerial inspection which would be conducted at least every 3 weeks (FEIS; Appendix U)[20].

Estimation of Undetected Rate of Leakage. HSSM was used to estimate the maximum steady-state leak rate (i.e., where infiltration is equal to leak rate out of the pipeline) per area of trench floor. A constant head of 7 ft was assumed based on the distance between the bottom of the trench and ground surface as discussed in Section 2.3.2.3 of the FEIS, see conceptual model shown in Figure 3). A head of 7 ft is a conservative assumption in that this head would only be attained as the oil reached ground surface. Leak rates higher than the maximum steady-state infiltration rate would eventually fill the pore-space in the trench backfill at a rate equal to the difference between the infiltration rate and the leak rate. This method results in an estimate of the approximate time for the surfacing of leaking oil for an assumed area of trench floor. Lateral spreading is not included in this simplified evaluation.

The results from HSSM simulations show that the maximum leakage rate of diluted bitumen that can be vertically infiltrated through permeable sand is approximately 0.005 bbl/d/ft^2 (0.2 gallons/day/ft^2) meaning that for every 1 ft^2 of trench floor, 0.005 bbl/day may infiltrate through that single square foot in 1 day. The area of the spill footprint on the bottom of the trench (i.e., infiltration site) affects the total rate of infiltration. For instance, a circular footprint of trench floor with a diameter of 3 ft (shown in the conceptual model shown in Figure 3) has an area of 7 ft^2, which would correspond to a total infiltration rate of 0.035 bbl/day (0.035bbl/day = 0.005 bbl/d/ft^2 × 7 ft^2). Thus, a leakage rate over the 3-ft diameter circle of 0.035 bbl/day could

[20] This is the statutory requirement for inspection intervals per the FEIS Appendix U. However, if the leak is located near residents or stakeholders who have been educated on identifying leakage signs, a more rapid identification of a leak is possible than considered for this analysis. This analysis assumes no such alternative detection.

theoretically infiltrate indefinitely without surfacing because the infiltration rate is equal to the leak rate.

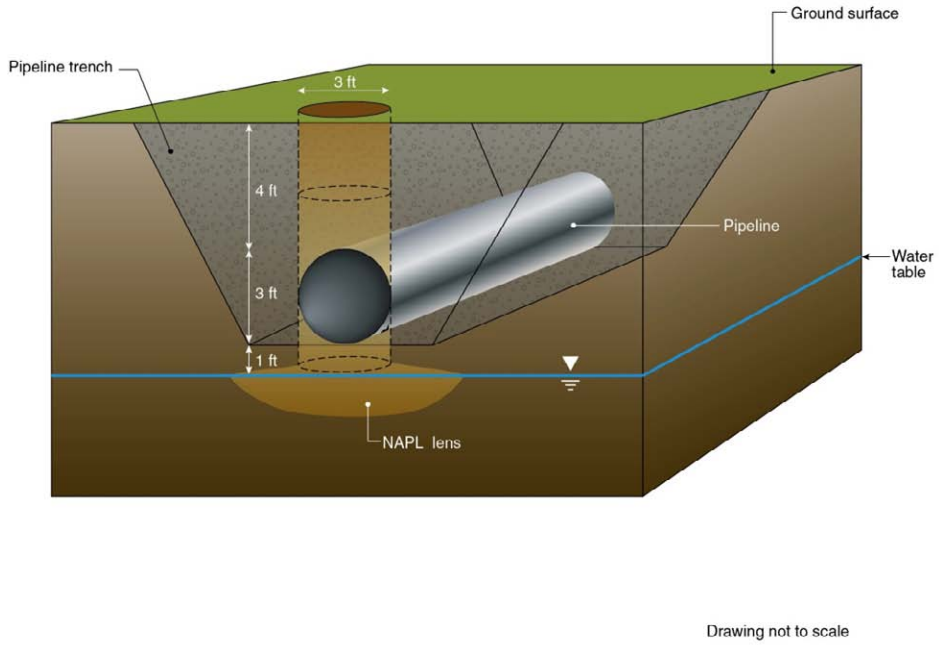

Figure 3. Conceptual model of slow leak. HSSM simulates LNAPL infiltration from trench bottom to water table and subsiquent formation of the NAPL lens.

To provide a sense of scale for a small leak that could go undetected, further analyses were conducted assuming infiltration occurs over a 3-ft diameter circle of trench floor; 3 ft was selected to coincide with the diameter of the pipe. However, the geometry and area of the spill footprint could be highly variable. If lateral movement of the oil through the trench backfill occurred, the area of the infiltration zone would increase, which would increase the volume of oil that could be infiltrated. These factors could result in higher leak volumes that may not express at the surface and therefore not be detected by inspection. Conversely, the vertical case considered for this analysis, rather than the lateral flow scenario, is also conservative in that the infiltration rate would be greater for a given area due to the larger head, which shortens the time to contamination of groundwater.

Figure 4 shows potential leak rates and the associated estimated time to detection. The time to detection was calculated by determining the flow exceeding the 0.035 bbl/day that can be infiltrated through the 3-ft diameter circular area shown in Figure 3. Flow in excess of this rate was assumed to fill pore spaces within a cylindrical volume of the backfill trench directly above the infiltration zone (shown in Figure 3). The total volume spilled was calculated as the product of the leak rate and the time to detection and is shown in Figure 4 as a function of time to detection.

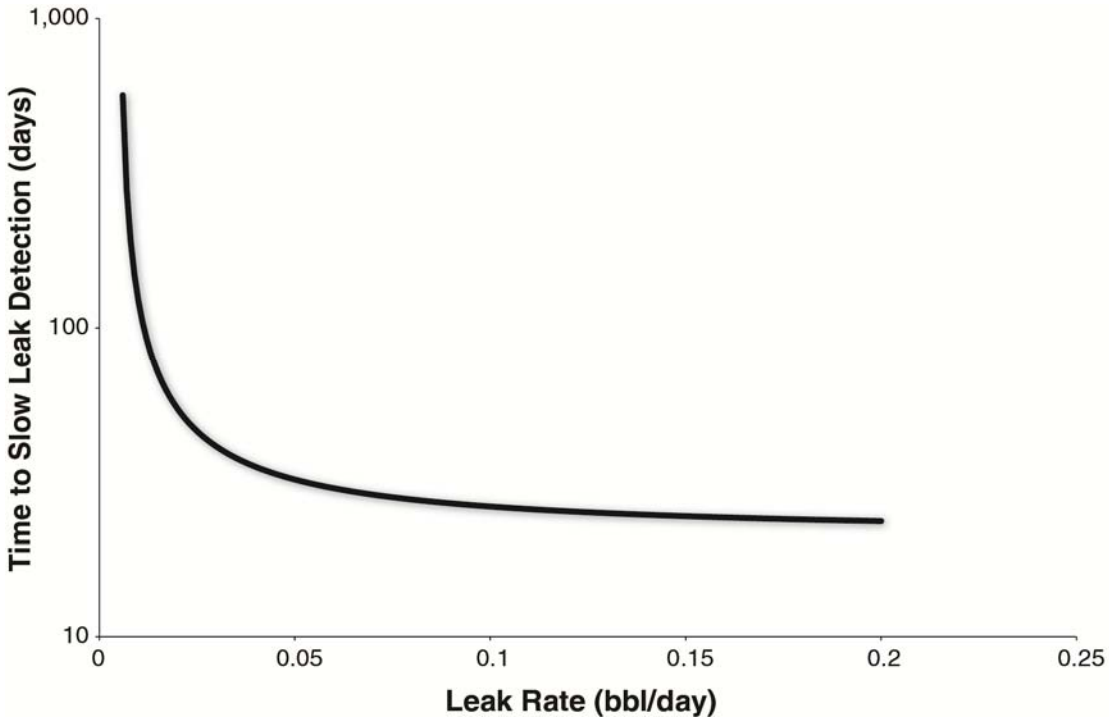

Figure 4. Time to slow leak detection as a function of leak rate for various slow leak rates based on a 3-ft diameter circular infiltration footprint and previously stated assumptions.

As an example, Figure 4 indicates that a leak rate of 0.05 bbl/day of diluted bitumen could be detected (by surfacing oil) within approximately 32 days (providing the underlying assumptions discussed above are met). This corresponds to a release of 1.6 bbl (67 gallons) of oil.

According to the report prepared by Battelle (2011), a leak rate of 28 bbl/day is expected from a "pin-hole" leak defined as a leak through a 1/32-in. diameter hole. The duration or time to surfacing would be dependent on the area over which oil infiltration occurs. If the oil spreads to a larger footprint, surfacing and potential detection will take longer than if the oil spreads to a smaller footprint. The size of the spill footprint will depend on several site-specific factors including but not limited to the permeability of trench backfill, and the permeability of soil surrounding the pipe trench. However, it is likely that a spill of 28 bbl/day would result in oil surfacing and being detected on the time scale of a few months. The "pin-hole" leak rate, 28 bbl/day, is almost three orders-of-magnitude greater than the maximum infiltration rate into permeable sand over the assumed area described previously under the small leak scenario. Therefore, a small leak that goes undetected indefinitely along the pipeline is unlikely.

Evaluation of Dissolved Plume Migration. The potential for development of a dissolved benzene plume was also considered for the constant 7-ft head condition used to estimate the steady-state infiltration rate under the small leak scenario. This results in a constant leak rate of 0.035 bbl/day over a 3-ft diameter circular infiltration area. This represents a hypothetical condition where the oil is near the ground surface but is not detected at the surface for a long period of time. The same transport and degradation conditions were used for these simulations

as used in the large-spill evaluation above. A plume was assumed to reach a downgradient location when simulated benzene concentrations reached 5 ppb. A leak duration of 2,000 days (5.5 years) was assumed, although this duration is likely longer than would be expected prior to detection[21]. The objective was to determine whether natural attenuation (i.e., degradation) mechanisms would limit plume size in the event of a release occurring over an extended time period.

Table 6 summarizes the simulated plume extent for dissolved benzene[22]. The plume sizes range from between 200 ft and 600 ft depending on transport and degradation conditions. These plume lengths are consistent with those in the literature discussed previously in this section and in the FEIS. Our assessment of consequence presumes that a small leak occurs at a location that is upgradient of an extraction well; such that is could be affect by the spill. However, if a small leak does occur, the likelihood that the leak would occur upgradient of a well or group of wells is low.

Table 6. Length of plume developing downgradient from pipeline and the time for this plume length to develop. Downgradient plume extent, time required to reach plume extent

	$t_{1/2}$ = 693 days		$t_{1/2}$ = 69.3 days	
Gradient	0.001	0.01	0.001	0.01
Plume length (ft)	200	600	100	200
Time to plume length (days)	411	324	218	100

In areas where groundwater is deeper, there is less likelihood of oil accumulating above the water table and therefore a small oil leak (less than the infiltration rate of the soil) may never appear at the surface unless the infiltration rate of the soil is exceeded by the leak rate. Although the oil may never surface, when groundwater is deeper, the oil may also not reach the aquifer for extended periods of time, or, more likely, much of it would be degraded before it reaches the aquifer. Leaks of this nature were not simulated directly, but would be assumed to be slow enough as to not exceed the maximum infiltration rate of the soil and therefore would likely only result in large release volumes if not detected for very long time periods (on the order of years). However, based on the small leak rates stated by Battelle (2011), 28 bbl/day, relative to the calculated maximum infiltration rates, 0.005 bbl/d/ft^2, an indefinitely undetected leak, while theoretically possible, is not likely to occur.

Along some stretches of the pipeline, the water table will be at or above the pipeline. In these instances, because the leaking oil would tend to float on the water table, a leak would likely be detected sooner than in the scenario described above because the thickness of the soil layer, and thus the volume available for oil to fill before surfacing, would be smaller. A leak below groundwater would result in earlier development of a dissolved plume and arrival of the plume

[21] Based on information provided in Battelle's report, the actual duration is more likely to be on the scale of months rather than years.

[22] Plume extent was determined by determining the maximum distance to which benzene exceeded 5 ppb in HSSM during the simulation.

at downgradient locations sooner after the leak occurs. The change in time for transport to receptor wells would be dependent on the area over which a leak occurs.

4.3.4 Evaluation of Sensitive Groundwater Areas

There are many wells that are near the pipeline corridor but are not within a defined HCA. For example, the FEIS in Section 3.3.1.1 identifies 29 private wells within approximately 100 ft of the proposed centerline of the pipeline[23]. In addition, Appendix X of the FEIS enumerates all wells, HCA and non-HCA, in Montana, South Dakota, and Nebraska that are within 1 mile of the pipeline. The FEIS also identifies a number of groundwater protection related HCAs in the Appendix P HCA and CPS maps.

Exponent was tasked to consider whether there may be sensitive groundwater resources that do not classify as HCAs but that might warrant additional protection beyond that being planned. Our approach to considering this involved identifying a distance within which wells might be at risk in the event of a spill, by considering characteristics of wells that would make them more or less vulnerable, and by reviewing aspects of planned spill prevention, control, and countermeasures. Based on our screening model analysis and a review of the literature, presented in Section 4.3.2.1, a distance of 1,000 ft is reasonable for identifying wells that might be within the influence of a plume of dissolved hydrocarbons such as benzene. The wells within 1,000 ft of the pipeline are those that, based on our preliminary analysis of dissolved plume migration, could potentially be affected in the event of a release from the pipeline[24]. To provide an example of how this distance criterion could be applied for wells not included within defined HCAs, Exponent conducted an independent review of the NEDNR well database in Nebraska. According to our screening of the database, approximately 260 wells occur within 1,000 ft of the proposed centerline of the pipeline[25]. For the most part, these wells would not be captured by the HCA analysis performed as part of the Risk Assessment. A table enumerating these wells and select data from the NEDNR database is shown as Appendix C. This table provides characteristics that are useful for considering the vulnerability of a well in the event of an oil spill and the potential human health or environmental implications of a plume reaching a well. This screening methodology may be applied to alternative routes as they are developed during the final design of the pipeline.

In earlier sections, we described how an oil spill would behave. Our analysis of the behavior of the oil itself indicated that the oil would remain in the soil or would reside near the surface of the water table and therefore would be unlikely to be entrained into a well. The spill components that could reach a well are those associated with hydrocarbons that dissolve into the groundwater. Our analysis showed that depth to groundwater is an important factor for plume development. Plumes are more likely to develop when the spilled oil is in close proximity or within the groundwater. For these reasons, wells adjacent to locations where the pipeline is

---

[23] Exponent's analysis of the NEDNR website indicates that 17 wells are less than or equal to 100 ft. Considering wells up to 160 ft from the pipeline results in 29 wells.

[24] 1,000 ft was selected based on the review of literature presented in Section 4.3.1 and our analysis results in Sections 4.3.2 and 4.4.3. This is meant to be a conservative distance (further than expected plume travel).

[25] Note that wells may only be located, at best, within ¼-¼ section areas.

within a few feet of the groundwater or within the groundwater would be more vulnerable than wells located elsewhere along the pipeline.

Well depth and pumping rate are other factors that can influence vulnerability to impacts from a dissolved hydrocarbon plume. Generally, shallower wells will be more vulnerable than deeper wells because of their proximity to the dissolved plume. Wells with higher pumping rates will also tend to be more vulnerable than wells with lower pumping rates, because they will have a larger impact on groundwater flow and thus a higher potential of drawing the dissolved plume towards them.

Based on the above, the following factors can be used to classify groundwater and associated wells with respect to vulnerability to a spill and to identify areas where additional protective measures may be warranted for sensitive groundwater resources (i.e., shallow aquifers and the wells constructed within these aquifers) that do not meet the listing criteria for HCAs:

- Proximity to the pipeline (<1,000 ft)
- Depth to groundwater (groundwater resources adjacent to pipeline segments that are within a few feet of groundwater or within groundwater are more vulnerable than groundwater resources that are located deeper)
- Depth of well (wells that are 10s of feet deep are more vulnerable than wells that are 100s of feet deep)
- Pumping of wells (wells with higher pumping rates are more likely to draw plumes than wells with lower pumping rates)
- Clusters of wells (clusters of wells would more likely draw plumes than individual wells).

The characteristics of wells in Appendix C provide some insight into the relative vulnerability to a dissolved hydrocarbon plume. Approximately 260 wells are identified. Appendix C does not include the depth to the upper water table and this information could be used to further differentiate groundwater with respect to vulnerability to the formation of a dissolve hydrocarbon plume resulting from an oil spill. The risk factors we have identified can be used to classify areas as being more or less vulnerable to a dissolved hydrocarbon plume in the event of an oil spill. In our view, the most vulnerable areas are locations with the following combinations of factors: areas that have a cluster of wells within 1,000 ft of a segment of pipeline that is in or within few feet of water table.

4.4 Transport and Fate in Surface Waters

Impacts to flowing surface waters are addressed in the FEIS by estimating the impact of benzene from a dilbit spill and a synthetic crude oil (SCO) spill. The assessment in the FEIS conservatively assumes that in a worst-case spill with a duration of 1 hour all of the benzene partitions from the oil into the water in streams with a range of flow rates. The assessment is useful for comparison of worst-case benzene concentrations to human health and ecological

concentration benchmarks and is discussed further in Section 3 of our review. The FEIS does not provide an evaluation of possible transport distances of oil via surface water. This appears to be a gap that needs to be addressed, considering that the Enbridge spill to the Kalamazoo River involved surface water transport of oil to distances greater than 10 miles from the spill location (U.S. EPA 2010). Surface water transport and fate analyses should take into account potential density increases associated with the loss of volatiles from heavy crudes and diluted bitumen, the effects of which were illustrated at Enbridge (NTSBA 2012). Ultimately, an analysis of transport and fate in surface waters is required by Special Condition 14 and PHMSA regulations as part of the Integrity Management Program as part of the final design of the project after the final route is selected. These evaluations should take into account the lessons learned from the pipeline rupture in Enbridge, Michigan in 2010.

5 Analysis of Risks Related to Small Stream Crossings

5.1 Introduction

While there are PHMSA-related regulatory requirements and mitigation and control measures specified in the Risk Assessment and FEIS for river crossings greater than 100 ft in width, Exponent was asked to evaluate whether there were sensitive environments associated with stream crossings that are less than 100 ft wide that may warrant additional analyses and perhaps mitigation measures. As described in this section, Exponent used a set of ecologically-relevant criteria to identify such areas. This part of the environmental review also included an examination of information in the FEIS related to special status species, in particular, the presence of these species and their habitats relative to small stream crossings.

As part of our small stream crossing evaluation Exponent performed the following tasks:

- Reviewed the adequacy of the risk characterization of PHMSA-defined HCAs (i.e., specifically focused on ESAs) in the Risk Assessment
- Evaluated whether there were other sensitive environmental resources downstream of small stream crossings not already identified by the PHMSA-defined ESAs
- Evaluated the adequacy of relying on benzene as a surrogate chemical to address the magnitude of aquatic toxicity of crude oil spilled into small streams
- Evaluated whether the Risk Assessment process adequately considered the presence of special status species (e.g., threatened and endangered species) when defining sensitive ecological resources.

For each of these tasks, we considered the ramifications of our findings in light of what effects the findings would have on the final Project design and emergency response planning (ERP). The following are Exponent's key findings/conclusions, followed by our recommendations. The remainder of this section provides the documentation to support these findings/conclusions and recommendations.

5.1.1 Key Findings/Conclusions

- The Risk Assessment appropriately followed standard PHMSA guidelines for identifying contributory pipeline segments (CPSs) associated with small stream crossings and the high consequence areas (HCAs) potentially affected.

- Based on transport and fate analyses described in Section 4 of our report, we used a downstream distance of 10 miles as a basis for identifying locations of sensitive areas around small stream crossings. Using a set of ecologically-relevant criteria, Exponent identified at least ten small stream crossings areas that should be considered for additional protection. An additional four small stream crossings were identified as having special water bodies within 10 miles downstream of the proposed centerline of the pipeline that likely have high wildlife habitat value which should also be given further consideration.

- Exponent agrees with the assessment of the potential magnitude of risk of an oil spill on aquatic life in the water column associated with the toxicity of dissolved hydrocarbons (represented by benzene). While the toxicity assessment based on benzene is not rigorous, it appears to be sufficiently conservative for assessing short-term effects to aquatic biota residing in the water column. However, depending upon the characteristics of the water body into which a spill occurs, some portion of the spilled oil could come into contact with shorelines or with the bottom of the water body and be entrained into sediments. The oil and associated chemicals that may be present within sediments could exert longer-term chronic effects on aquatic biota that are not captured by considering benzene alone.

- Exponent determined that the list of special status species identified in the FEIS was a comprehensive and a complete list in the Project area. Exponent also found that the preliminary findings of "May Affect, Not Likely to Adversely Affect (NLAA), No Effect (NE) or Not Applicable (NA)" for 29 of the 30 species and "May Affect, Likely to Adversely Affect (MALAA)" for 1 species (American burying beetle) were arrived at through a sufficiently rigorous review of the distribution, abundance, and biological use of the Project area by special status species.

- Exponent believes that there could be habitat utilized now or in the future by special status species that is not specifically identified as PHMSA-designated ESAs based on our review of information in the FEIS.

- Exponent believes ongoing natural shifts in resources underpinning the distribution and abundance of special status species and the species they rely upon will likely result in a shifting of locations where special status species occur during the lifetime of the Project. Keystone is planning annual updates along the entire pipeline route. This will include new consultations with USFWS to identify critical T&E species that may not be captured within the existing PHMSA database, and may result in the environmental protection of additional areas along the pipeline corridor.

5.1.2 Recommendations

- A distance of at least 10 miles downstream from the proposed centerline of the pipeline should be used for the identification of sensitive areas and for identifying CPSs during the final design phase of the Project.
- Based on location-specific analyses of fate and effects of spills that Keystone will undertake prior to construction, consider the use of additional valves and/or noninvasive boring technologies at the small stream crossings that Exponent identified as associated with additional potentially sensitive ecological areas, and where Keystone's release analysis shows the potential exists for medium to very large spills to occur.
- Keystone should rely upon stream-specific specific scour analyses for small stream crossings to identify where the pipeline should be buried deeper than 5 ft or where HDD may be warranted. The particular small stream crossings identified by Exponent should be given attention in this regard.
- While Exponent is not charged with reviewing the ERP, we recommend that the ERP consider the possibility that spilled oil may be entrained into sediments and that these types of conditions be anticipated as part of response and clean-up.
- The ERP should also take into account the sensitive areas identified in our review (e.g., Rainwater Basin, small stream crossings associated with ESAs, and special downstream water bodies). For example, wildlife habitat for special status species, within close proximity of the pipeline could be designated as "special and/or unique areas" for purposes of the ERP.
- Exponent recommends that Keystone develop explicit plans for updating the status and presence of special status species and the habitat they rely upon every 2 years, and that identified changes be incorporated into the ERP.

5.2 Small Streams

The FEIS defines small streams crossed by the pipeline as streams less than 100 ft in width. For major stream crossings greater than 100 ft, the pipeline design uses horizontal directional drilling (HDD), which places the pipe well below the stream bed (i.e., 25 ft or greater). The HDD method will not disrupt the stream bed because the pipe is placed in a borehole that is drilled beneath the streambed and drilling occurs well back from the stream bank. For small stream crossings there is no requirement to use HDD, so in most places the pipeline will cross small streams using open-cut crossings (dry, flowing, dry flume, or dry dam-and-pump). According to discussions with Keystone, during the final design phase of the pipeline, specific small stream crossings will also use HDD or micro-bore methods to cross the stream if scour analyses indicate that the pipe would have to be placed deeper than 5 ft below the stream bed to protect it from stream bed erosion. According to Keystone, the crossing method for each stream will be identified in the 401 crossing permit applications that will be evaluated by the U.S.

Army Corps of Engineers. For purposes of our review, because this final design is not yet completed, we conservatively assumed that the pipeline would be buried only 5 ft below the streambed for all the small stream crossings. As a consequence of the shallower burial depth, small stream crossings may be at higher risk of a pipeline rupture as a result of scouring or other bed disturbance. All streams (both large and small) crossed by the pipeline are listed in Tables E-1 and E-2 in Appendix E of the FEIS.

5.3 High Consequence Areas

The Risk Assessment used PHMSA-defined HCAs within specified distances of the pipeline to determine CPSs. Several types of HCAs were considered, including populated areas, drinking water protection areas, and ESAs. Depending on the receptors and potentially complete pathways, the various types of HCAs had different buffers from the pipeline. CPSs were defined using the HCA proximity rules listed in the Risk Assessment with site-specific hydrology assessments conducted as needed to evaluate viable downstream pathways.

Exponent reviewed the CPS identification process using the maps and information provided in the Risk Assessment. A review of the maps revealed that several CPSs were not identified where the southern end of the Houston Lateral passes directly through a populated area (MP 36.7–41 and 43.6 to 47.2 [Figure 5]). CPSs should have been identified where the pipeline is within 1 mile of a populated area or within 5 miles of a viable downstream connection to a populated area. Exponent communication with Keystone staff indicates that this was a mapping error, but according to Keystone, the areas were included in the HCA analysis and summary. Given the topographical specificity needed to accurately determine a viable downstream pathway, Exponent did not re-analyze the downstream pathway along the entire 1,375-mile pipeline and instead relied on the accuracy of the original analysis.

While the southern end of the Houston Lateral was the only section of the pipeline that clearly violated the CPS identification rules, the rules themselves (specifically the distances) seemed arbitrary. The explanation provided for the distances selected for each type of HCA was either vague or absent. As the analysis described in Section 4 indicates, evaluating viable downstream pathways to a distance of 10 miles, rather than 5 miles, would be more appropriately protective of HCAs. Exponent has been informed by Keystone that they plan to evaluate downstream transport for more than 20 miles.

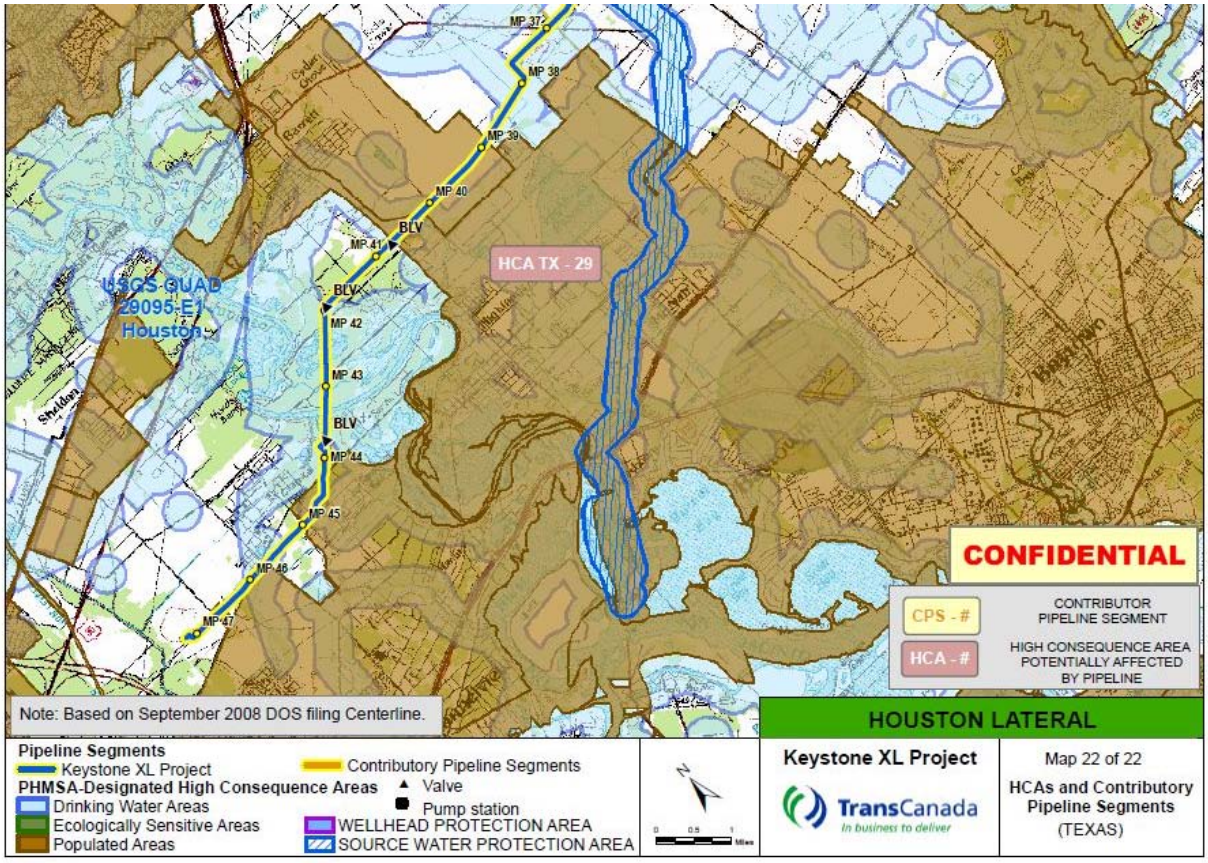

Figure 5. Project passes directly through a populated area and no CPS is identified

While it is very likely that more HCAs will be identified by expanding the downstream search criteria for HCAs from 5 to 10 miles, the purpose of the Risk Assessment was to identify CPS locations, where one or more HCAs could be affected. It is likely that most CPSs are identified using a 5-mile limit for stream and river crossings. However, it is also possible that HCAs may not be encountered within the first 5 miles; thus, extending the search criteria to 10 miles could identify CPSs that may have been missed using the 5 mile criterion. As part of its charge to examine whether sensitive environments are associated with small stream crossings, Exponent carried out several types of analyses, one of which was to examine HCAs located 5–10 miles downstream of stream crossings. Based on discussions with Keystone, it was explained to Exponent that the 5-mile limit was only used for purposes of the FEIS, and that as part of the final design, HCAs located more than 20 miles downstream from the pipeline will be considered if there is a viable flow pathway (e.g., from small stream crossings).

In order to complete our assessment of sensitive environments associated with small stream crossings, Exponent requested information on HCAs within 10 miles of the pipeline in a GIS format that was readily mapped over the pipeline route. Exponent considered what effect such an analysis might have by searching for HCAs located within 10 miles downstream, but more than 5 miles downstream, of the pipeline. This preliminary analysis identified 60 additional HCAs in Nebraska alone (Figure 6). If applied along the entire length of the pipeline, this adjustment in the search criteria distance will likely result in the identification of more HCAs

potentially affected by a spill. We recognize that many of these HCAs will have already been captured by the existing CPS analysis since many HCAs are co-located along major river systems. Although each HCA that is identified by such a process will need further evaluation of type (population, groundwater municipal intake, or ecologically sensitive area) and hydrologic connectivity, it is likely that such an analysis will result in the designation of additional CPSs. This detailed analysis is required by Special Condition 14 and by federal regulations. Such a detailed analysis was beyond the scope of Exponent's review because it requires in-field analysis of the conditions near the pipeline.

5.4 Ecologically Sensitive Areas

As described in the Risk Assessment and according to 49 CFR 195, PHMSA identifies ESAs using the following criteria:

- An area containing critically imperiled species or ecological community
- Multi-species assemblage areas
- A migratory water bird concentration area
- Areas containing imperiled special status species or imperiled ecological communities where the species is aquatic, aquatic dependent, or terrestrial with a limited range
- An area containing special status species where the species or community occurrence is one of the most viable, highest quality, or best condition, as identified by an element occurrence ranking (EORANK) of A or B.

The Risk Assessment used PHMSA-identified ESAs to determine CPSs. However, it is possible that the ESA criteria are unnecessarily narrow and may exclude some areas that are very important to sensitive fish and wildlife populations, as identified in the FEIS. Exponent gave consideration to additional areas of special ecological concern other than those identified by PHMSA by considering wetlands of special concern and important wildlife habitats crossed by the pipeline, as identified in the FEIS. Exponent also evaluated where small streams crossed by the pipeline sustained important fisheries within at least 0.5 miles of the pipeline (as identified in Section 3.7 of the FEIS). In addition, Exponent searched for major waterbodies up to 10 miles downstream of the pipeline (as opposed to the 5 miles considered in the Risk Assessment) that were hydrologically connected to small streams crossed by the pipeline.

As an additional check on the comprehensiveness of PHMSA-designated ESAs, Exponent searched for Nature Conservancy sites within 10 miles of the pipeline. Locations from http://my.nature.org/preserves/ were mapped as an overlay on the pipeline route. No Nature Conservancy sites were identified within 10 miles on either side of the pipeline.

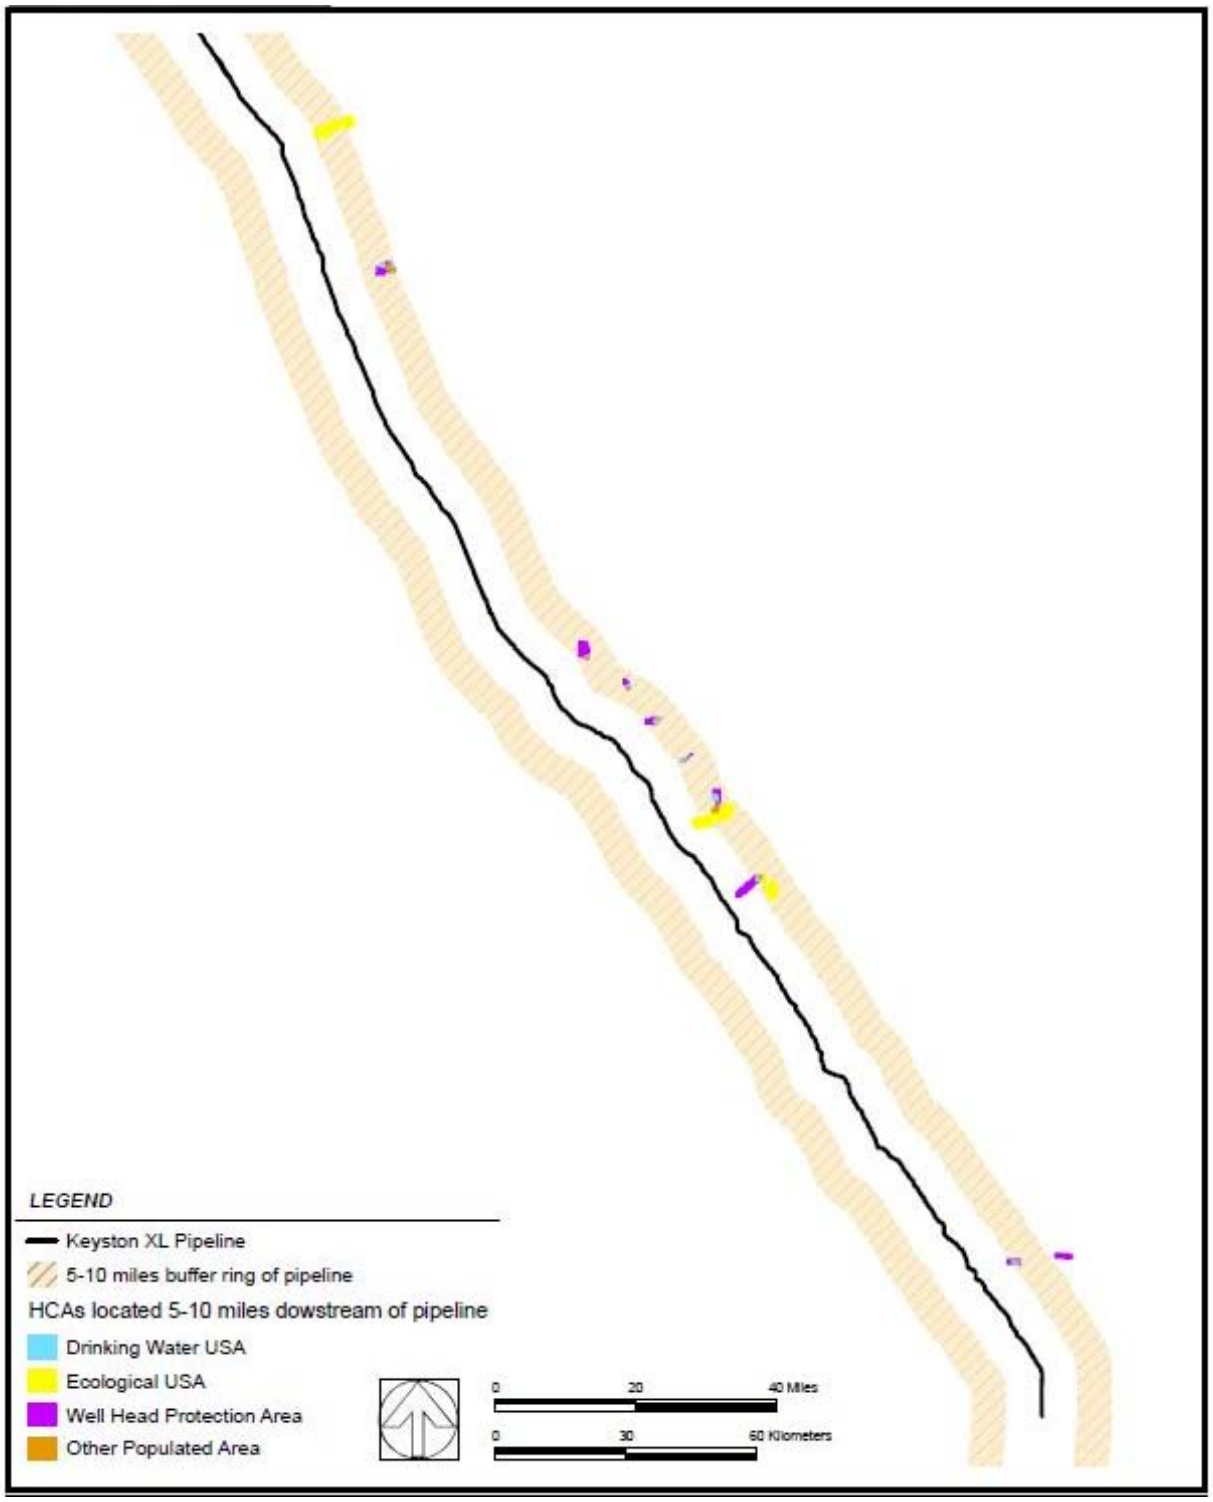

Figure 6. HCAs located between 5 and 10 miles downstream of the Project in Nebraska

5.4.1 Areas of Special Ecological Consideration

Exponent compiled location and pipeline crossing information for additional areas of special ecological concern (as defined above) in Appendix B using information provided in the following documents:

- FEIS Tables
  - Table 2.3.3-1. Waterbodies Crossed Using the Horizontal Directional Drilling Method
  - Table 3.4.2-1. Number and Type of Wetlands Crossed by the Proposed Project within Wetland Areas of Special Concern or Value
  - Table 3.6.2-1. Important Wildlife Habitats within or near the Proposed Project ROW
  - Table 3.7.2-1. Proposed Perennial Stream Crossings at or Upstream of Fisheries Habitat along the Proposed Project Route
- FEIS Appendix P. Pipeline Risk Assessment and Environmental Consequence Analysis
  - Attachment 2 CPS/HCA Risk Ranking Table of Appendix C
- FEIS Appendix E
  - Table E-1. Waterbodies Crossed by the Project – Steele City
  - Table E-2. Waterbodies Crossed by the Project – Gulf Coast
  - Table E-4. Waterbodies within 10 Miles Downstream of Proposed Water Crossings.

After compiling Appendix B, Exponent used the data to identify locations where the pipeline crosses small streams near multiple areas of special ecological consideration (i.e., fisheries, wildlife habitat, wetlands, major waterbodies, or special waterbodies). Pipeline stream crossings in the vicinity of multiple areas of special ecological consideration were identified as posing higher risk to ecological resources if they were not already designated in the FEIS as CPSs or as HDD crossings. Pipelines crossing larger waterways (i.e., stream crossings of greater than 100 ft) using HDD techniques were deemed to have a lower risk of rupture than non-HDD crossings as a result of their substantial depth (≥25 ft) below the stream bed. In addition, crossings identified as posing higher risk to ecological resources had to meet at least one of the following two specific criteria:

1. Stream crossings with at least four of the following five attributes: wetland areas of special concern or value, important wildlife habitats, fisheries within 0.5 miles downstream, waterbodies within 10 miles downstream, and

waterbodies within 10 miles downstream with high quality habitats (defined in Section 5.4.2).

2. Stream crossings with all three of the following FEIS-defined attributes: wetland areas of special concern or value, important wildlife habitats, and fisheries within 0.5 miles downstream.

The following small stream crossings were identified by Exponent as posing higher risk to ecological resources using these two criteria:

- **Keya Paha River, Nebraska (MP 599.9):** As identified in the FEIS, the Project crosses this perennial river at a location with wetlands of special concern (NE Sand Hills Wetlands), with important wildlife habitat (Keya Paha River Valley), and within 0.5 miles of a fishery (Class A WW).
- **Niobrara River, Nebraska (MP 615.38):** As identified in the FEIS, the Project crosses this perennial river at a location with wetlands of special concern (NE Sand Hills Wetlands), with important wildlife habitat (Niobrara River Valley), and within 0.5 miles upstream of a fishery (Class A WW).
- **South Fork Elkhorn River, Nebraska (MP 630.46):** As identified in the FEIS, the Project crosses this perennial river at a location with wetlands of special concern (NE Sand Hills Wetlands), with important wildlife habitat (Sand Hills), and within 0.5 miles of a fishery (Class A WW). The crossing is also within 10 miles upstream of Atkinson Reservoir.
- **Holt Creek, Nebraska (MP 647.31):** As identified in the FEIS, the Project crosses this perennial creek at a location with wetlands of special concern (NE Sand Hills), with important wildlife habitat (Sand Hills), and within 0.5 miles upstream of a fishery (Class A WW).
- **South Fork Elkhorn River, Nebraska (660.22 and 660.23):** As identified in the FEIS, the Project crosses this perennial river at a location with wetlands of special concern (NE Sand Hills Wetlands), with important wildlife habitat (Sand Hills), and within 0.5 miles of a fishery (Class A WW).
- **Big Blue River, Nebraska (MP 765.5):** As identified in the FEIS, the Project crosses this perennial river at a location with wetlands of special concern (Rainwater Basin Wetlands), with important wildlife habitat (Rainwater Basin), and within 0.5 miles upstream of a fishery (Class B WW).
- **Lincoln Creek, Nebraska (MP 774.93):** As identified in the FEIS, the Project crosses this perennial stream at a location with wetlands of special concern (Rainwater Basin Wetlands), with important wildlife habitat (Rainwater Basin), and within 0.5 miles upstream of a fishery (Class B WW).
- **West Fork Big Blue River (MP 789.57):** As identified in the FEIS, the Project crosses this perennial river at a location with wetlands of special

concern (Rainwater Basin Wetlands), with important wildlife habitat (Rainwater Basin), and within 0.5 miles upstream of a fishery (Class A WW).

- **Unnamed tributary to Turkey Creek, Nebraska (MP 807.54):** As identified in the FEIS, the Project crosses this perennial stream at a location with wetlands of special concern (Rainwater Basin Wetlands), with important wildlife habitat (Rainwater Basin), and within 0.5 miles upstream of a fishery (Class B WW).
- **Cotton Creek, Texas (MP 457.92 and 457.96):** As identified in the FEIS, the Project crosses this perennial creek at a location with wetlands of special concern (Water Oak–Willow Oak Community) and within 0.5 miles upstream of a fishery (high value). The crossing is also within 10 miles upstream of Big Thicket National Preserve.

These stream crossings warrant additional consideration and may necessitate additional protective measures or special consideration in the ERP. The Risk Assessment acknowledges that spills may be transported downstream up to 5 miles, and Exponent's analysis (see Section 4) indicates that transport distances of 10 or more miles are reasonably likely. Keystone indicated to Exponent during the review process that the detailed transport and fate analysis that will be conducted after the pipeline is constructed, as required by Special Condition 14 and federal regulations, will identify CPSs associated with HCAs located more than 20 miles downstream. Exponent also notes that the 208 fisheries located within 0.5 miles of the pipeline (FEIS Table 3.7.2-1) may be at risk from a spill due to acute toxicity of the oil (see Section 3); however, we considered small streams to be of special ecological concern only if they had three or more critical attributes as described above (e.g., fisheries, wildlife habitat, etc.).

5.4.2 Major Waterbodies

Exponent gave special consideration to Table E-4 in Appendix E of the FEIS to identify waterbodies within 10 miles of the pipeline that may provide high quality wildlife habitat. The 10-mile distance was used as a criterion based on transport and fate considerations that suggested spills of oil to a stream can reasonably move downstream this distance or greater (refer to Section 4). Therefore, the 5-mile criterion used in the FEIS and Risk Assessment (Appendix P) did not appear to be sufficiently protective. Downstream waterbodies include lakes, reservoirs, and proposed reservoirs, most of which are likely to attract migratory water birds at some times of the year. Exponent identified stream crossings with waterbodies within 10 miles downstream of the proposed centerline for the pipeline that are likely to provide high quality habitat to these birds (Appendix B). High quality habitat was subjectively defined for purposes of our evaluation using descriptions of the waterbodies within the "comment" column in Appendix B. Waterbodies that were described as wildlife management areas, year-round bird watching areas, and preserves were designated high quality habitats for purposes of our assessment. We used the spirit of the ESA definition provided earlier to identify those waterbodies that were considered associated with areas of high quality habitat. These waterbodies, all in Texas, included:

- **Pat Mayse Lake:** This lake is situated on the western edge of Pat Mayse Wildlife Management Area. The wildlife management area is an 8,925-acre area managed for recreational uses such as hunting, wildlife viewing, and camping.

- **Lake Bob Sandlin (and Lake Cypress Springs which is contiguous with Lake Bob Sandlin):** This lake is a 9,400-acre reservoir which provides eagle viewing in the winter and other bird watching opportunities year round.

- **Waterbodies Associated with Big Thicket National Preserve:** This preserve is a UNESCO "Biosphere Reserve" noted for the high biodiversity that results from its mix of virgin pine and cypress forest, hardwood forest, meadow, and blackwater swamp.

- **Waterbodies Associated with Trinity River National Wildlife Refuge**: This 25,000-acre wildlife refuge is valued for its high diversity of waterfowl species. Nearly 50 percent of the neotropical bird species listed by USFWS use this wildlife refuge during migration or nesting.

5.5 Toxicity Assessment

Exponent reviewed the aquatic toxicity information presented in Section 4.2.3.4 of the Risk Assessment (Appendix P of FEIS) in light of the information on crude oil (dilbit) chemical content and composition to evaluate whether the conclusions were based on adequately conservative assumptions for small stream crossings. The Risk Assessment's analysis of toxicity in surface water resulting from a release to small streams focused on the toxicity resulting from benzene alone. While benzene is a toxic constituent of crude oil, it is one of many crude oil constituents and forms only a very small proportion of the total volume and potential toxicity. Oil can also result in physical effects as has been described in the FEIS.

Exponent investigated the possibility that other crude oil constituents may pose a greater toxicological risk to aquatic organisms than benzene by evaluating the potential of the following constituents to cause toxicity to aquatic organisms: ethylbenzene, toluene, xylene, nickel, vanadium, chrysene, fluorene, naphthalene, and phenanthrene. Concentrations of the metals and BTEX constituents are shown in Table 1 and PAH concentrations are listed in Table 3. Based on this information, quantitative estimates of water concentrations of these chemicals resulting from a spill could be determined. Using the known water solubility of the different constituents and the same assumptions about water flow rates and sizes of releases as used in Tables 4-7 and 4-8 of the Risk Assessment, Exponent approximated the concentrations of these constituents in surface waters following a release. Although these water concentrations were meant to model an acute event (1 hour of stream flow), we compared them to EPA ecological benchmarks that are protective of aquatic life chronically exposed to these chemicals (EPA Region 6, 7, or 8 benchmarks were given priority; in the absence of any of those, national level criteria were applied [U.S. EPA 2011]).

This evaluation indicated that, of the crude oil constituents evaluated, only nickel and vanadium were likely to exceed chronic water quality thresholds and that these constituents were only

likely to exceed for large (10,000 barrels) or moderate (1,000 barrels) spills, but not smaller spills (Tables 7–10). Since these findings show less risk than predicted for benzene, the Risk Assessment's evaluation of toxicity resulting from spills to surface water appears to be sufficient for judging the potential for toxic effects on aquatic organisms. If cleanup was delayed or incomplete, as the oil in a spill ages the concentrations of alkylated PAH compounds will increase on a relative basis as more volatile compounds evaporate, and they will tend to persist for a longer time than their parent non-alkylated forms. The prediction of acute toxicity from most spills into small- to medium-sized streams based on the conservative assessment of benzene toxicity is sufficiently conservative to account for this eventuality. As noted here and in the FEIS, spilled oil can also have physical effects that can adversely affect some wildlife species such as birds and habitats if, for example, the oil comes into contact with soils and sediments.

Exponent recognizes that dilbit also contains additional toxic constituents such as naphthenic acids. While data are lacking on concentrations of these chemicals in the crude oil, it should be noted that these acids are more soluble than similarly size hydrocarbons, and are highly acutely toxic to zooplankton (0.15 mg/L), although less so to fish (25 mg/L) (Clemente and Fedorak 2005). While acid concentrations are reduced by the caustic washing of tar sand to produce dilbit, the FEIS has not discussed the possibility that these chemicals could contribute to the toxicity associated with a spill. However, as our analysis has shown, the selection of benzene within the Risk Assessment to judge the potential for toxicity provides a reasonable basis for assessing the potential for risks to aquatic organisms. Still, because crude oils are complex mixtures, Exponent recognizes there are remaining uncertainties that will be addressed during a response following a spill.

5.6 Special Status Species

DOS submitted a Biological Assessment for the Keystone XL Pipeline that evaluated potential impacts of construction and operation (including spills) to special status species and their habitats. The Biological Assessment was reviewed by USFWS and on September 23, 2011, the USFWS issued a Biological Opinion that concurred with the DOS findings.

Because many of the special status species of concern within the Project area rely on wetlands and other water resources, Exponent reviewed Section 3.8, T&E Species, of the FEIS with special attention to both the large and small stream crossings (also referred to here as wetlands and/or riparian areas collectively). Exponent also reviewed the cumulative impact section of the FEIS (Section 3.14.3.8), with special attention to those cumulative impacts that might impact special status species in wetlands and riparian areas located at or downstream of small stream crossings. Finally, Exponent reviewed Appendix C of 49 CFR 195 to ascertain if the proposed future monitoring of the Project was sufficient to protect special status species from future environmental changes.

5.6.1 General Special Status Species Review

Exponent determined that the list of some 30 threatened, endangered, proposed-for-listing, and candidate-for-listing species covered in Section 3.8 (including 4 mammals, 9 birds, 1 amphibian, 6 reptiles, 4 fish, 2 insects, and 4 plants) was a comprehensive and a complete list of the relevant special status species in the Project area.

Similarly, Exponent determined that the correct federal agencies were consulted during the FEIS process. Specifically, that USFWS provided T&E consultation relative to the Endangered Species Act (ESA), the Fish and Wildlife Coordination Act (FWCA), the Migratory Bird Treaty Act (MBTA), Bald and Golden Eagle Protection Act (BGEPA), and National Environmental Protection Act (NEPA).

Exponent found that the preliminary findings of "May Affect, Not Likely to Adversely Affect (NLAA), No Effect (NE) or Not Applicable (NA)" for 29 of the 30 species and "May Affect, Likely to Adversely Affect (MALAA)" for 1 species (American burying beetle) were arrived at through a sufficiently rigorous review of the distribution, abundance, and biological use of the Project area by T&E Species.

5.6.2 ESAs for Special Status Species

As stated earlier in this section, it is possible that the ESA criteria as specified by PHMSA are narrow with regard to T&E and other special status species. Considering this fact, Exponent used the example of the whooping crane, which is the most imperiled of the T&E species identified in the FEIS, to illustrate that there are other non-ESA defined areas associated with stream crossings that should be considered for additional mitigation during the final design of the Project.

5.6.2.1 Whooping Crane

The Project generally follows much of the migratory corridor of the whooping crane, which runs from Canada to Texas (Figure 7). While the Project is either to the east (in the north) or to the west (in the south) of the migration corridor, the Project does intersect the migration corridor substantially, for nearly 500 miles at the South Dakota/Nebraska line (Figure 7). Furthermore, whooping cranes (Lewis 1995), as well as piping plover (Elliott-Smith and Haig 2004) and least terns (Thompson et al. 1997), are known to use small and large stream areas and other wetlands during migratory stopovers (cranes, plovers, and terns) and as annual breeding habitats (terns and plovers). There are a number of ESAs and CPSs identified along the whooping crane migration corridor.

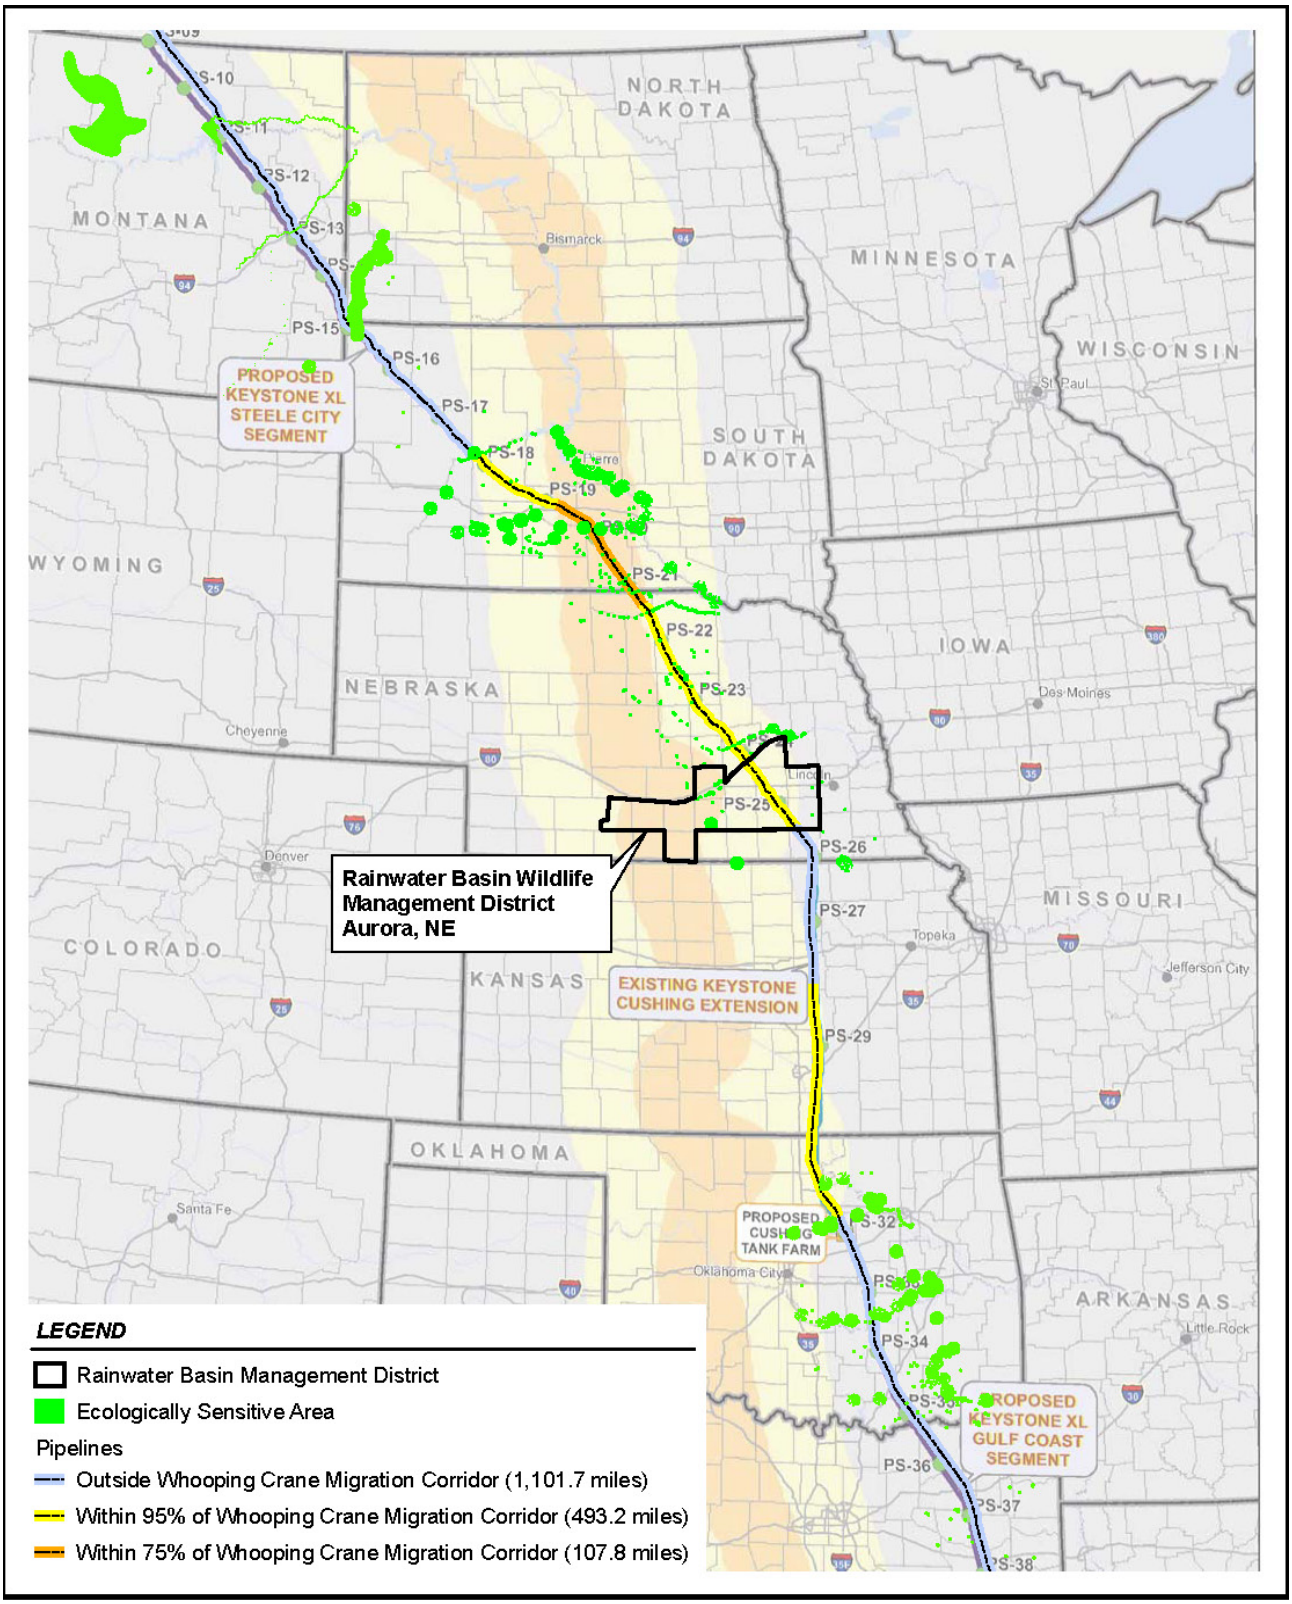

Figure 7. Ecologically sensitive areas (green) are shown within and near the region of the Project that crosses 75% and 95% the whooping crane migration corridor

However, the Project is routed directly through the Rainwater Basin Wildlife Management District (RBWMD) in southeastern Nebraska (Figure 8), and thereby has the potential to impact this important known whooping crane and shorebird migration stopover site (WHSRN 2004). USFWS manages 61 Massie Waterfowl Production Areas (WPAs) in the Rainwater Basin, and the Nebraska Game and Parks Commission manages 35 State Wildlife Management Areas within the Rainwater Basin. The Rainwater Basin Joint Venture, founded in 1992, is a broad coalition of government agencies, non-government organizations, and farmers dedicated to acquisition, restoration, and management of the region's wetlands and surrounding upland habitats. In 2005, the Nebraska Natural Legacy Project (the State's wildlife action plan) identified the Rainwater Basin as a biologically unique landscape. There are also 80 Wetland Reserve Projects within the Rainwater Basin (WHSRN 2004).

There is the possibility that whooping cranes may already be using the RBWMD and/or may relocate into suitable wetlands within the RBWMD during the lifetime of the Project. Some of the potential wetlands within the RBWMD are identified as ESAs. However, many of the wetlands that whooping cranes and other birds could conceivably use or move into near the Project within the RBWMD are not considered ESAs as defined by PHMSA.

Exponent reviewed the information on special status wetlands provided within Table 3.4.2-1 of the FEIS and cross referenced that information to stream crossings within the RBWMD (refer to Appendix B). Removing stream crossings from consideration that are already CPSs or where HDD methods will be used to cross the small stream, there are 59 small stream crossings within the RBWMD that have special status wetlands at the stream crossing that could potentially be used by whooping cranes and other wetland dependent special status species. For this reason, Exponent recommends that these stream crossings should be considered for additional mitigation measures to protect the whooping crane habitat of the RBWMD, because of its importance as a stopover area for feeding and resting by the whooping crane.

Lastly, while most whooping cranes stay within their migration corridor, whooping cranes are seen outside the corridor on a regular basis and may have even begun prospecting new areas (Lewis 1995). Related to this point, many other special status species are capable of utilizing new areas on a yearly basis. A further complication is that according to USGS (2004), many water bird habitats within the RBWMD may be in a state of deterioration, and may already be compelling whooping cranes to utilize unprotected wetlands within the Project. Therefore, Exponent suggests that Keystone should conduct a bi-annual consultation with USFWS to identify areas of high potential for use by special status species and to update the Project ERPs as appropriate.

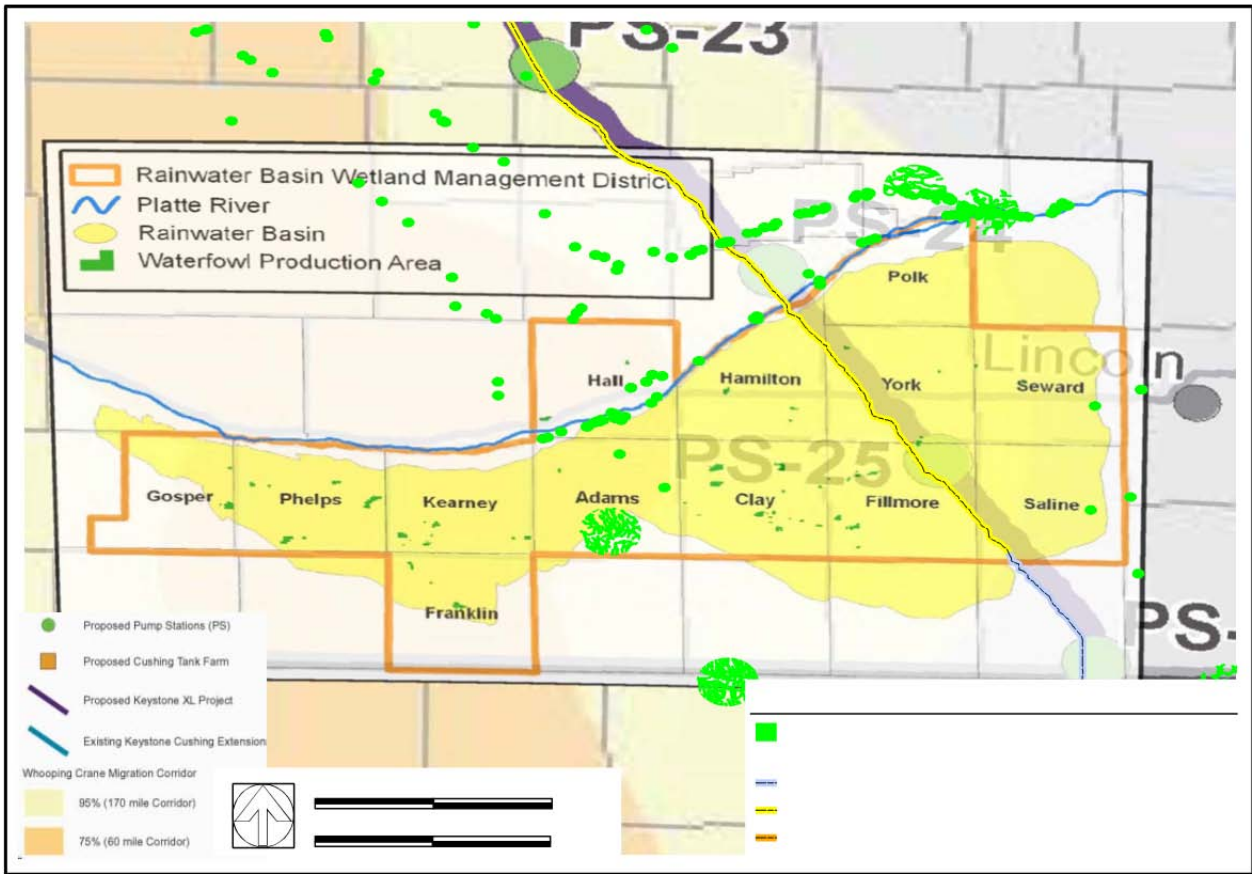

Figure 8. The Project intersects the Rainwater Basin Wetland Management District (shown in yellow), yet few of the wetlands in the RBWMD are identified ESAs.

5.6.3 Recommendations for Special Status Monitoring

Appendix C of CFR 195 (§195.452(d)(3)) states: "An operator is also responsible for periodically evaluating its pipeline segments to look for population or environmental changes that may have occurred around the pipeline and to keep its program current with this information." Yet closer examination of this section of the CFR reveals that it only pertains to physical factors that might impact pipeline integrity and does not explicitly include any biological aspects that might help detect any future impacts to T&E and other special status species. Slightly more relevant to T&E populations is CFR §195.452(d)(3) which states: "An operator must incorporate a new unusually sensitive area into its baseline assessment plan within one year from the date the area is identified. An operator must complete the baseline assessment of any line pipe that could affect the newly-identified high consequence area within five years from the date the area is identified." However, as discussed earlier in this section, these conditions would still not consider additional protection for areas not defined as HCAs (e.g., ESAs), such as the areas identified earlier within this section.

Given the 50-year projected lifespan of the Project and the possibility that one or more special status species may move into the vicinity of the Project during that timeframe, Exponent

concludes that the monitoring outlined in CFR 195 may be insufficient to protect special status species over the lifespan of the Project. Specifically, Exponent recommends that in addition to monitoring physical factors that might impact pipeline integrity, Keystone develop a biological monitoring plan for these special and unique special status habitats to periodically determine whether T&E and other special status species are using these habitats within the Project area and whether they are afforded sufficient protection under the ERP.

Sungwoo Ahn, Ph.D.
Senior Scientist

Professional Profile

Dr. Sungwoo Ahn is a Senior Scientist in Exponent's Environmental Sciences practice who specializes in the transport and fate of hydrophobic organic contaminants including PAHs, PCBs, and polybrominated diphenyl ethers (PBDEs), and their bioavailability. Dr. Ahn also has expertise in the environmental behavior of nanomaterials. He is knowledgeable in the use of a variety of laboratory analytical methods including gas chromatography (GC) and mass spectrometry (GC/MS), transmission electron microscopy (TEM), scanning electron microscopy (SEM), x-ray photoelectron spectroscopy (XPS), and x-ray diffraction (XRD).

Before joining Exponent, Dr. Ahn worked as a postdoctoral scholar at Stanford University, where he conducted research on the degradation of flame retardant PBDEs by various forms of nano-scale zerovalent iron (nZVI). Dr. Ahn studied the reaction kinetics and the degradation pathways of PBDEs with positional preference in the debromination. As a part of the research, he synthesized the nanoparticle, as well as its catalyzed and carbon supported particles, in the laboratory and characterized them using analytical tools such as TEM, SEM, XPS, and XRD.

During his Ph.D. work, Dr. Ahn studied the transport and fate of PAHs in contaminated soil and sediment amended with a carbon sorbents for *in situ* contaminant stabilization. The study included physicochemical characterization of contamination at the micro-scale for source identification, assessment of PAH bioavailability and availability to the surroundings, and model simulation of contaminant mass transfer in sediment-sorbent systems, to predict the fate of PAHs and the long-term effect of carbon amendment. In addition, he also has extensive field and laboratory experience in *in situ* stabilization of PCBs in contaminated sediment using carbon amendment.

Gary N. Bigham, L.G.
Principal

Professional Profile

Mr. Gary Bigham is a Principal in Exponent's Environmental Sciences practice who specializes in the evaluation of transport, fate, and effects of contaminants in aquatic habitats, soil, sediment, and groundwater. He has managed and been the principal investigator of field, laboratory, and theoretical assessments of a wide variety of contaminants in lakes, rivers, estuarine waters, ocean waters, and groundwater. Mr. Bigham has also directed RI/FSs, human health and ecological risk assessments, cost allocation studies, and NRDAs for sites involving soils, sediments, and waters contaminated with arsenic, chlorinated benzenes, dioxin, mercury, metals, PAHs, PCBs, petroleum hydrocarbons, and solvents. He has also completed several evaluations of mercury in indoor air. Recent examples of contaminant transport and fate analyses include the development of a numerical model of mercury cycling and bioaccumulation for Onondaga Lake; a detailed evaluation and modification of sediment transport and PCB bioaccumulation models for the Fox River and Green Bay, Wisconsin; and an evaluation of the effects of eutrophication on mercury bioaccumulation in the Florida Everglades. Mr. Bigham is the author of numerous publications on the behavior of mercury in the environment.

Mr. Bigham has been designated an expert witness in class action and individual tort claims on the issue of PCB and PAH transport in streams and rivers, and dioxins/furans in a lake; in litigation involving mercury bioaccumulation in the Florida Everglades; and assessments of exposure to mercury vapor, crude oil, and produced water. Mr. Bigham has also completed environmental forensic investigations of mercury-contaminated sediments and soil, groundwater contaminated with chlorinated solvents and petroleum hydrocarbons, and for allocation of remediation costs of a PAH-contaminated sediment site in Boston Harbor. He has also had a lead role in NRDAs related to mercury contamination in surface waters and involving solvents in groundwater. He has also served as a consulting expert on a major NRD claim involving confined animal feeding operations (CAFOs) in Oklahoma and Arkansas.

Mr. Bigham's international experience includes serving as resident manager for a multi-year air quality and marine environmental monitoring program in Saudi Arabia. He led the technical development of a natural resource damage claim for the Kingdom of Jordan to the United Nations Compensation Commission for damages arising from the first Gulf War. He recently completed an environmental assessment for a major oil export facility in Abu Dhabi and evaluated potential human exposure to spilled oil and produced-water discharges in the Amazon basin of Ecuador. He applied a water quality model to predict conditions in and downstream of a proposed reservoir in Bolivia and assessed water quality and greenhouse gas emissions for a proposed reservoir in Guyana. He has also completed an assessment of potential human exposure to mercury vapor from a spill in the Peruvian highlands.

Paul D. Boehm, Ph.D.

Principal Scientist and Group Vice President

Professional Profile

Dr. Paul D. Boehm has overall responsibility for Exponent's Environmental business. He has devoted his 34 years of consulting experience to advising industrial, legal, and government clients on scientific aspects of: contaminated sediments and terrestrial sites; oil spills; and the use of environmental forensic methods to investigate background contamination, to chemically fingerprint contaminants to determine sources, to apportion contamination to allocate liabilities, and to reconstruct historical releases and doses. Dr. Boehm has provided scientific support to clients on natural resource damage assessments, environmental and toxic tort claims, maritime pollution cases, and other litigation matters, including providing expert testimony. His work as an analytical, environmental, and geo-chemist has involved petroleum hydrocarbons, fuel additives, natural gas, polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), chlorophenols, chlorinated solvents (TCE, PCE), mercury, lead, and other chemicals and elements. A significant part of Dr. Boehm's work has focused on oil refineries, fuel terminals, and offshore platforms; marine and aquatic oil spills; Superfund sites; manufactured gas plant (MGP); pulp and paper mills, and natural gas storage fields; medical exposures; and transactional disputes. With regards to chemical releases, he specializes in the historical reconstruction of release histories. With regards to petroleum fuels he has focused on petroleum chemistry associated with evolution of refining processes and the use of fuel additives such as alkylated leads, MTBE, TAME, and other compounds.

Dr. Boehm has been engaged in numerous natural resource damage assessments (NRDAs) at oil spill and CERCLA sites where he has provided technical support on sources, divisibility, bioavailability of PAHs, PCBs, petroleum and other chemical sources; exposure and bioavailability; divisibility and apportionment of contamination, and allocation of associated liability. His extensive knowledge of the strategic application and practice of environmental forensics (geo-chemical fingerprinting, transport and fate, source attribution, and allocation) has been applied to numerous cases involving complex environmental liability and litigation matters.

As an oil spill expert, he has studied and published on the fate and effects of most major oil spills in the United States, Europe, and the Middle East. As a natural gas and petroleum chemist and geochemist, he has also investigated geochemical aspects relating to the migration of natural gas from storage fields. His work has also included assessments of the exposure of people to petroleum contaminants in toxic tort cases.

He has been appointed to serve on several national panels on environmental/ marine pollution and has served on several National Research Council panels.

Ronald J. Breitmeyer, Ph.D.
Senior Associate

Professional Profile

Dr. Ronald Breitmeyer is a Senior Associate in Exponent's Environmental Sciences practice. Dr. Breitmeyer is a geoenvironmental engineer and hydrogeologist specializing in environmental modeling. Dr. Breitmeyer has expertise in the study and modeling of multi-phase flow and transport in a wide variety of geomaterials. He has experience with numerous environmental modeling tools and software, including HYDRUS, UNSATH, MODFLOW, HSSM, AERMOD, and CALPUFF. Dr. Breitmeyer has conducted research on characterization and modeling of liquid flow in bioreactor landfills and in landfill covers. He has expertise in laboratory testing and field-scale experimentation and instrumentation for characterizing the mechanical and hydraulic properties of geomaterials. He has also designed, fabricated, and operated custom laboratory equipment and instrumentation for geomaterial testing.
Dr. Breitmeyer also has experience performing feasibility-level remediation cost estimates for contaminated sites and accrual purposes and has experience using RACER to develop remedial cost estimates.

Anne Fairbrother, DVM, Ph.D.
Principal Scientist and Office Director

Professional Profile

Dr. Anne Fairbrother is a Principal Scientist in Exponent's EcoSciences practice, with more than 30 years of experience in Ecotoxicology, wildlife toxicology, contaminated site assessment, and regulatory science for existing and emerging chemicals in the U.S. and Europe. She recently served on a Science Advisory Panel to the state of Utah and as a consultant to the British Columbia (BC) Ministry of Environment to set site-specific water quality standards for selenium that protect fish and wildlife. She has conducted large-area (>100 sq mile) risk assessments at mines in tropical, desert, and mountain ecosystems, determining risk thresholds for plants and wildlife. She provided consultation on future development of mine pit lakes, assessed the risk to livestock from use of wastewater on irrigated pasture during mine closure operations, and conducted an assessment of risk to terrestrial and aquatic organisms from an abandoned mercury mine. Dr. Fairbrother conducted an assessment of the potential ecological risks to aquatic life in San Francisco Bay and coastal southern California posed by use of copper pipes. She also assessed risks to wildlife at sites contaminated with organic chemicals, including DDT, PCBs, dioxins, and petroleum hydrocarbons in Delaware, Texas, Oregon, and California, integrating ecological risks with human health risk assessments.

As a consultant, Dr. Fairbrother has supported various chemical industry groups in compiling and reviewing data from the literature in support of both U.S. and European regulatory processes. Historically, this included preparation of screening information data sets (SIDs) for submission through EPA to the OECD's High Production Volume (HPV) data call-in program. More recently, she also has input the data into the IUCLID database for Europe-wide risk assessments and the REACH chemical registration program.

Dr. Fairbrother has participated in or led the development of guidance documents for ecological risk assessments. For example, she was co-author of the EPA's *Framework for Metals Risk Assessment* and for BC Ministry of Environment guidance for implementing Tier 1 ecological risk assessments of contaminated sites and for setting soil clean-up values, and participated in the development of Ecological Soil Screening Levels (Eco-SSLs) for EPA.

While a scientist at the EPA, Dr. Fairbrother led research into the ecological risks of bioengineered crops, methods for assessing risks of nanomaterials, and some of the early guidance for field assessments of Superfund sites and effects of pesticides on birds. She researched and developed methods for assessment of chemical effects on bird immune and endocrine systems.

Dr. Fairbrother has published more than 80 peer-reviewed articles and book chapters that reflect her expertise in wildlife toxicology, immunotoxicology, endocrine-disrupting chemicals, and ecological risk assessment. She serves on numerous scientific boards, expert panels, and

editorial boards in support of scientific and regulator y issues. A veterinarian and Certified Wildlife Biologist, Dr. Fairbrother served as President of the Society of Environmental Toxicology and Chemistry, American Association of Wildlife Veterinarians, and Wildlife Disease Association (WDA). She is the recipient of the WDA Distinguished Service Award (2002), and a gold medal for Commendable Service from EPA. Dr. Fairbrother holds an adjunct professorship at Oregon State University, Department of Environmental and Molecular Toxicology.

Ashley Kaiser
Senior Scientist

Professional Profile

Ms. Ashley Kaiser is a Senior Scientist in Exponent's EcoSciences practice. Ms. Kaiser has 10 years of experience as an environmental professional, including more than 7 years in consulting. She works as a risk assessor, assistant project manager, data analyst, researcher, and health and safety coordinator. In these roles, her responsibilities have included human health and ecological risk calculations, project management, statistical analysis, site assessment, research, compliance assurance, sampling method development, and biotic and abiotic fieldwork.

Ms. Kaiser has experience evaluating human health and ecological risks from chemicals in soil, groundwater, surface water, tissue, and air on sites where PCBs, dioxins, PAHs, and/or metals are the primary chemicals of interest. She has provided technical support for multiple projects in Oregon, Washington, and California at a wide range of sites, including retail gasoline stations, bulk petroleum terminals, former gun clubs, abandoned mine sites, electrical substations, lumber mills, and in-water sediment areas. With an interdisciplinary background and a versatile skill set, Ms. Kaiser specializes in projects that do not fit into well-defined categories.

Academic Credentials and Professional Honors

Exponent®

Michael W. Kierski, Ph.D.
Managing Scientist

Professional Profile

Dr. Michael Kierski is an environmental biologist and toxicologist who provides senior-level expertise in human and ecological risk assessment and evaluation of complex environmental problems. Over the past 24 years, Dr. Kierski has evaluated risks associated with chemicals in air, soil, water, sediment, and biota to both people and the environment. He brings specialized expertise on the fate and effects of metals such as lead, hydrocarbons such as benzene and polycyclic aromatic hydrocarbons (PAHs), synthetic organic chemicals such as PCBs, pesticides, chlorinated solvents, and explosives.

Much of Dr. Kierski's work is directed toward the evaluation, remediation, and redevelopment of contaminated properties. This requires not only technical expertise but also an ability to work with regulatory agencies at the state level (e.g., in Indiana, Wisconsin, Iowa, Illinois, Michigan, New York, North Carolina, New Jersey, etc.) and at the federal level (EPA, U.S. Fish and Wildlife Service, and the Department of Defense). Dr. Kierski's primary clients include electric and gas utilities, chemical companies, the Department of Defense, law firms, and other environmental and engineering companies. Dr. Kierski is often called upon to represent these clients in public and regulatory forums.

Dr. Kierski has extensive training and practical experience in the areas of environmental toxicology, environmental biology, and environmental chemistry, which he has used to develop scientifically defensible approaches for the risk evaluations he has performed. He has utilized this experience within a wide variety of risk assessment projects, tailoring each assessment to the particular needs of his clients. He has emphasized practical applications of risk assessment techniques on projects over his career, using innovative techniques as needed to meet his client's specific needs.

Academic Credentials and Professional Honors

Ph.D., Environmental and Occupational Health, University of Minnesota, 1992
B.A., Environmental Biology, St. Mary's College of Minnesota, 1984

Exponent®

Sheryl Law
Managing Scientist

Professional Profile

Ms. Sheryl Law is a Managing Scientist in Exponent's EcoSciences practice. She has a strong background in environmental chemistry including extensive work in aquatic systems, contaminant modeling and analytical instrumentation (ion chromatography, neutron activation, spectrophotometry, atomic absorption spectrometry, high performance liquid chromatography, gas chromatography, and mass spectrometry). She has experience coordinating with chemical laboratories to develop analytical methods and sample preparation techniques for identification of chemicals that cannot be identified with conventional analyses. Her research with chiral analysis of optical isomers has applications in fields of natural attenuation and fate and transport modelling. She is broadly trained in environmental science and chemistry and provides strong technical support on ecological risk assessments, natural resource damage assessments, litigation projects and site remedial investigations. In addition, she is an experienced technical writer and has prepared a variety of data reports and literature reviews.

She received her MBA with a focus on enterprise risk and sustainability or corporate social responsibility issues. She has researched the value of public companies with respect to their "triple bottom line" and has created decision analysis models that derive additional cash flow from ecological assets, mitigation banks, and carbon credits.

Academic Credentials and Professional Honors

M.B.A., Seattle University, 2006
M.S., Environmental Chemistry, University of Toronto, 2000
B.Sc., Environmental Science, University of Toronto *(honors with distinction)*, 1998

University of Toronto Fellowship Award (2000); University of Toronto Open Fellowship Award (1998); Golden Key Honor Society Top 15% Scholar; NSERC Undergraduate Research Award in Industry

Jane Ma, Ph.D.
Senior Scientist

Professional Profile

Dr. Jane Ma is a Senior Scientist in Exponent's EcoSciences practice. She has a strong interdisciplinary background in geosciences and Computer Science including extensive work in geographic information systems (GIS), remote sensing, landscape/watershed analysis, geostatistics, on-line web mapping, environmental/ecological model implementation, and decision support system (DSS) development. Her scientific expertise is principally in the areas of water resources management, with an emphasis on wetland assessment. Her study involves with aquatic habitat evaluation, wetland vulnerability assessment, headwater wetland mitigation, low-impact Best Management Practices (BMPs) design, and watershed-scale ecological restoration study.

Dr. Ma is highly skilled in geospatial analysis and GIS programming. She is experienced in ArcGIS suite, ERDAS, Plone, PostgreSQL and programming languages in Visual Basic, Python, and C++. She has developed numerous desktop and web-based GIS applications customized to meet the requirement of different projects.

Academic Credentials and Professional Honors

Charles A. Menzie, Ph.D.

Principal Scientist and Practice Director

Professional Profile

Dr. Charles A. Menzie is a Principal Scientist and Director of Exponent's Ecological and Biological Sciences practice. Dr. Menzie's primary area of expertise is the environmental fate and effects of physical, biological, and chemical stressors on terrestrial and aquatic systems. This includes work on chemicals in the environment, oil and gas operations, fossil fuel and nuclear power plants, alternative energy projects, invasive species, and climate change impacts. Dr. Menzie has worked at more than 100 hazardous waste sites, including many high-profile Superfund Sites and NRDA-related cases. He has been called upon to evaluate environmental damage claims related to the use of pesticides, herbicides, and other chemicals. He has provided expertise related to the environmental implications of atmospheric emissions and of point and nonpoint sources of nutrients and toxic chemicals to aquatic and marine environments (through Total Maximum Daily Loads or TMDL programs). Dr. Menzie has worked on a broad range of contaminants, including solvents (TEC, PCE, TCA, and others), persistent chlorinated compounds such as PCBs, dioxins, and pesticides, as well as hydrocarbons including PAHs, cyanides, and metals such as lead, hexavalent chromium, mercury, and cadmium. Employing his deep understanding of risk-based studies and remediation, Dr. Menzie has directed the development of work plans, the implementation of remedial investigations, and the selection of remedial measures, on behalf of individual potentially responsible parties (PRPs), as well as PRP groups. Dr. Menzie has worked in all EPA Regions, including the Midwest and South (Regions 4, 5, and 6), the Northeast and East Coast (Regions 1, 2, and 3), and the West (Regions 8, 9, and 10). He has an active international practice including projects in Ecuador, Uruguay, and Yemen. He has extensive litigation experience and has provided steady and compelling advice and guidance in many controversial and contentious situations. He is the co-inventor of SediMite™, a low-impact method for remediating contaminated sediments.

Dr. Menzie is recognized as one of the leaders in the field of risk assessment and was awarded the Risk Practitioner Award by the Society for Risk Analysis. He has served on the Councils of SRA and SETAC, the two major professional organizations in this field. Dr. Menzie has led numerous peer reviews for industry and for government. He has taken the lead in developing guidance documents for industry and government and has focused on methods that are workable and acceptable to a broad range of parties. He has developed and applied a formal causal-analysis methodology for assessing causation in cases of environmental impairment and contributions of chemical contamination. He was one of the committee members to draft the ASTM Standard for risk-based corrective action (RBCA) for chemical release sites and extended that standard to ecological considerations. He served on the National Research Council's Committee on Bioavailability of Chemicals in Soils and Sediments. In addition to his work on chemical risk-related matters, Dr. Menzie has developed and applied methods for identifying third parties who have contributed to contamination in aquatic and terrestrial environments. These projects have involved meshing historical information with transport-and-

fate analyses, risk considerations (remediation drivers), and forensic analyses. He has provided expert advice on historical use and disposal of asbestos products and historical assessments of asbestos in fill.

Academic Credentials and Professional Honors

Ph.D., Biology, City University of New York, 1978
M.A., Biology, City College of New York, 1974
B.S., Biology, Manhattan College, 1971

Licenses and Certifications

OSHA Certified Eight-Hour HAZWOPER Annual Refresher Training in Hazardous Waste Operations and Emergency Response, updated annually; OSHA Certified 40-Hours of Training in Hazardous Waste Operations and Emergency Response

Farrukh Mohsen, Ph.D., P.E.
Senior Managing Engineer

Professional Profile

Dr. Farrukh Mohsen is a Senior Managing Engineer in Exponent's Environmental Sciences practice. He has 34 years of experience in hydrogeology and groundwater flow and contaminant transport modeling. He has applied his technical strengths in assisting corporate clients nationwide by providing expert opinions in litigation, environmental compliance, and liability allocations. Dr. Mohsen focuses primarily on developing an understanding of the transport and fate of constituents in the subsurface in both groundwater and soil vapor. He has helped his clients by determining the source of groundwater contamination, designing and evaluating remedial options, conducting risk assessments and regulatory negotiations, achieving environmental compliance, delivering public presentations, providing expert opinions, and refuting claims by other experts. He serves as both a testifying and consulting expert.

Prior to joining Exponent, Dr. Mohsen worked as Senior Project Manager at Gannet Fleming and Environ International Corporation. He has been a Visiting Professor at Rutgers University, a Visiting Fellow at Princeton University, an Associate Professor at the University of Petroleum and Minerals, and a lecturer at Bangladesh University of Engineering and Technology.

Academic Credentials and Professional Honors

Kirk O'Reilly, Ph.D., J.D.
Managing Scientist

Professional Profile

Dr. Kirk O'Reilly is a Managing Scientist in Exponent's Environmental Sciences practice and is based in Bellevue, Washington. He has more than 25 years of experience investigating the interaction between environmental and biological chemistry, and spent 15 years as an in-house consultant for a major oil company. He is a recognized expert in environmental chemistry, petroleum source identification, and bioremediation, and has played a significant role in developing the oil industry's technical response to managing MTBE in the environment. Dr. O'Reilly was a founding member of Chevron's Oil Spill Environmental Functional Team and is trained in aspects of spill management, response, monitoring, and remediation. He has responded to spills of both crude oil and refined products, and served as on-site liaison to environmental regulators. Dr. O'Reilly has provided litigation support in toxic tort and property damage suits, and managed projects focused on the remediation of soils, sediments, and groundwater, as well as on improving industrial wastewater treatment. Specific contaminants studied include crude oil, refined products, chlorinated solvents, wood treatment compounds, pesticides, and fertilizers. He developed innovative methods for monitoring the transformation and assessing the risk of petroleum. He has also conducted toxicity identification evaluations on refinery effluents and managed waste and water issues on offshore platforms. Experienced working within the constraints of the RCRA, CERCLA, and NPDES programs, Dr. O'Reilly promotes the use of strategic site assessments to reduce costs while improving quality. He has participated in collaborative research projects with regulators at the federal, state, and local levels, and taught technical courses sponsored by regulatory agencies, universities, and industrial trade groups. Dr. O'Reilly is a member of the Washington State Bar.

Academic Credentials and Professional Honors

Exponent®

Richard Podolsky, Ph.D.
Senior Managing Scientist

Professional Profile

Dr. Richard Podolsky is a Senior Managing Scientist in Exponent's EcoSciences practice. Dr. Podolsky's training is in ecology and he assists clients with all aspects of environmental compliance, including environmental conservation, natural resource assessments, ecological/environmental restoration, site assessment/site investigations (SA/SI), habitat evaluations, resource conservation and recovery, the Migratory Bird Treaty Act (MBTA), Marine Mammal Protection Act (MMPA), National Environmental Policy Act (NEPA), and Endangered Species Act (ESA), particularly Section 7 Consultations pertaining to ESA.

Dr. Podolsky has 30 years of experience in assisting land developers and oil, gas, and electric generation companies in reducing potentially adverse environmental effects of a wide range of projects and achieving regulatory compliance. He is experienced in researching and successfully applying cost-effective, state-of-the-art environmental techniques, materials, and software to new development and mitigation projects, proactively addressing the environmental concerns of nonprofit organizations and community groups, and troubleshooting with governmental officials to achieve regulatory compliance. Dr. Podolsky has worked on the impact of the built environment on wildlife, especially wind and solar power, artificial lighting big boxes, skyscrapers, and communication and utility towers.

Dr. Podolsky has in-depth experience with the application of computers and modeling to scientific problems, specifically with GIS integration, pattern recognition, data mining, risk assessment, and remote sensing. He regularly designs and develops software and models for environmental scientists, including the Avian Risk of Collision (ARC) Model, which quantifies risk of birds around wind turbines and communication towers; FullPixelSearch, an image mining software tool; GAIA, the first GIS designed for Macintosh OS; Diversidad, a software model for mapping biodiversity hot spots; and FireTower, a software tool for modeling wildfire spread.

Academic Credentials and Professional Honors

Walter J. Shields, Ph.D., C.P.S.S.

Principal Scientist and Practice Director, Environmental and Earth Sciences

Professional Profile

Dr. Walter Shields is the Director of Exponent's Environmental and Earth Sciences practice. A Certified Professional Soil Scientist, he specializes in the study of transport and geochemical fate of toxic pollutants and their environmental effects. He has 34 years of experience conducting and managing environmental studies in more than 30 states and four Canadian provinces. He provides scientific and strategic consultation to industrial clients on the design and implementation of CERCLA and RCRA investigations, cost-effective remediation approaches, and negotiations with state and federal agencies. Dr. Shields manages multidisciplinary investigations, risk assessments, and feasibility studies. He investigates the industrial archeology of sites to understand the history of contaminant sources in a given area. He serves as an expert witness in environmental forensics and has testified on the origin, transport, and fate of chemicals in air, soils, sediments, surface water, groundwater, and biota, and exposure of humans and ecological receptors to those chemicals. He has particular expertise in the environmental chemistry and source identification of dioxins and furans, PCBs, PAHs, and heavy metals and metalloids. Dr. Shields has also testified on the allocation and appropriateness of remediation costs at a variety of sites. He has specialized expertise in the forest products industry and at mining and smelting sites.

Academic Credentials and Professional Honors

Ph.D., Soil Science, University of Wisconsin, 1979
M.S., Forest Management (Soil Science), University of Idaho, 1976
B.S., Forest Science, University of Washington, 1974

Scott S. Shock, P.E.
Managing Engineer

Professional Profile

Mr. Shock is a Managing Engineer in Exponent's Environmental Sciences practice. His diverse project experience includes site investigation and characterization, contaminant transport and fate, human health and ecological risk assessment, soil and groundwater remediation, groundwater modeling, cost analysis, and litigation support. Mr. Shock has planned and implemented numerous field investigations involving a wide variety of contaminants in soil, groundwater, and sediment. He is skilled in data interpretation and evaluation, and development of effective conceptual site models.

One of Mr. Shock's specialties is assessing environmental impacts associated with mining, particularly in sensitive habitats. He is a leader in the development of proactive and preventive risk management strategies designed to minimize the environmental impacts of mining. Mr. Shock is also skilled in risk communication, and in facilitating cooperation among diverse stakeholder groups.

Mr. Shock's cost analysis experience includes feasibility studies under CERCLA and RCRA, and cost allocations associated with cost recovery litigation and insurance coverage. He employs tools such as cost/benefit analysis, Monte Carlo uncertainty analysis, sensitivity analysis, uncertainty reduction (e.g., through targeted supplemental data collection), net environmental benefits analysis, and other decision analysis methods to help clients make more informed and robust remediation and liability management decisions.

Mr. Shock's contaminated-site remediation experience includes evaluating and comparing remedial technologies; costing, planning, and implementing field pilot tests of remediation systems; and designing and supervising the installation, startup, monitoring, and closure of full-scale remediation systems. He has evaluated ongoing remedial actions to improve operational performance, and has assessed the appropriateness of past remedial actions in support of litigation and cost allocation negotiations, particularly with respect to volatile organics in soil and groundwater.

Randall Wentsel, Ph.D.
Senior Managing Scientist

Professional Profile

Dr. Randall Wentsel is a Senior Managing Scientist in Exponent's EcoSciences practice. Dr. Wentsel has over 30 years of experience in environmental sciences in areas including: sediment, aquatic, and terrestrial toxicology; ecological risk assessment; research strategies; and science policy. Dr. Wentsel has authored over 30 open literature publications, 70 government publications, and various book chapters addressing state-of-the-art techniques and environmental toxicology and risk assessment issues.

One of Dr. Wentsel's strengths is the ability to lead multi-disciplinary groups of scientists to address complex issues and to delineate attainable goals; these efforts have resulted in providing guidance to the scientific community. Primary examples (that he has led or co-led) include the Environmental Protection Agency (EPA) Framework for Metals Risk Assessment, the EPA Office of Solid Waste and Emergency Response (OSWER) Guidance on Ecological Soil Screening Levels, a White House Committee for Environment and Natural Resources (CENR) document on Ecological Risk Assessment in the Federal Government, and a DoD Tri-service guidance on Ecological Risk Assessment.

Dr. Wentsel has served in several Federal government positions. He was the National Program Director (NPD) for Contaminated Sites/Resource Conservation in the EPA's Office of Research and Development (ORD), where he provided scientific direction of the program, strategic planning, and documentation of research impacts and applications. In the EPA Office of Water, Dr. Wentsel was a Branch Chief and supervised a staff addressing nutrient criteria, biosolids issues, and sedimentation criteria. He also worked in the ORD National Center for Environmental Assessment and the Office of Science Policy. Working for DoD, Dr. Wentsel managed research activities in ecological risk assessment, aquatic and terrestrial toxicology and biotechnology at the U.S. Army Edgewood Research, Development, and Engineering Center.

Dr. Wentsel has a unique breadth of experience in science policy through completion of the Senior Executive Fellows program at the JFK School of Government, Harvard University, being chosen as the SETAC Science Fellow on the U.S. Senate Environment and Public Works Committee, serving as the DoD member on the White House National Science and Technology Council, Committee on the Environment and Natural Resources, and working with the White House Office of Science and Technology Policy staff on risk and cost benefit issues.

Dr. Wentsel is active in peer review panels, advisory committees, and technical workshops. In the EPA development of ecological risk assessment (ERA) methods, Dr. Wentsel was a peer reviewer on the ERA Framework report, case studies, and guidelines. Technical workshops

have included: assessing multiple stressors to ecosystems, ecological risk management, population modeling, soil quality standards, and bioavailability.
